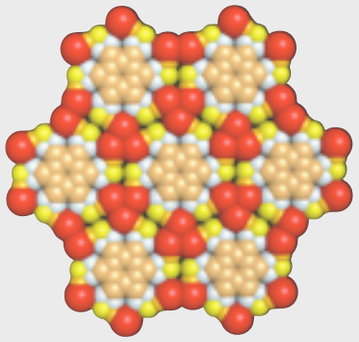
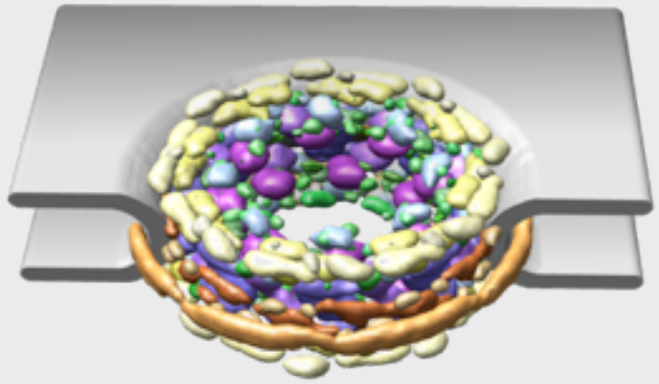
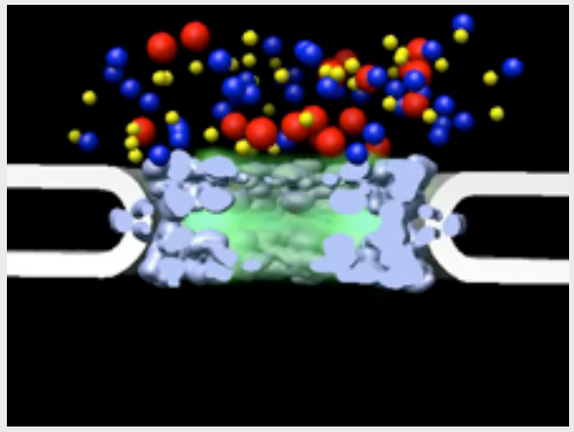
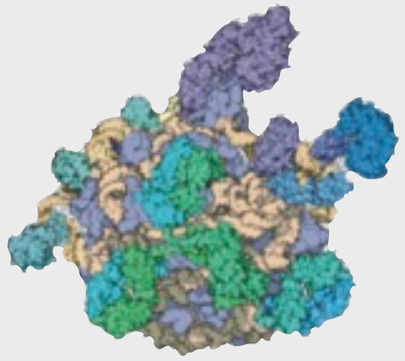
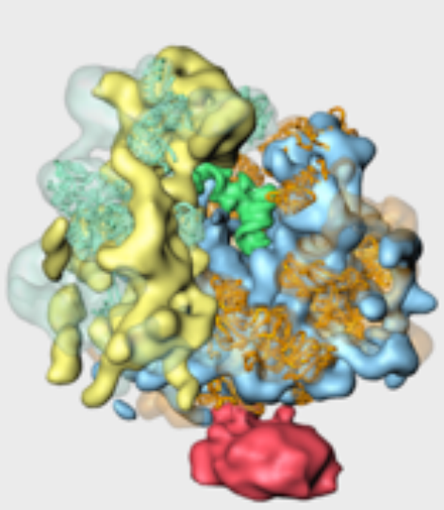
Integrative Structural Biology

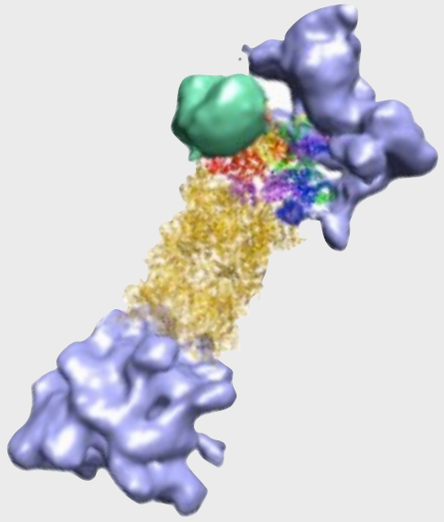


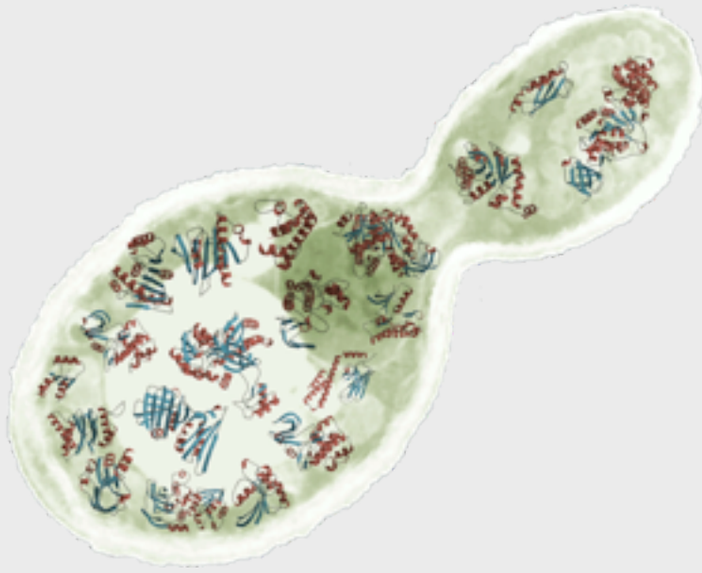












Andrej Sali

http://salilab.org/

Department of Bioengineering and Therapeutic Sciences

Department of Pharmaceutical Chemistry

California Institute for Quantitative Biosciences

University of California, San Francisco

Contents

1. Integrative (hybrid) structure determination
2. EM images as a source of spatial restraints

   Application to the Nup84 complex
3. Multiple fitting of subunits into an EM map of the whole assembly

   Application to the 26S proteasome

Contents

1. Integrative (hybrid) structure determination
2. EM images as a source of spatial restraints

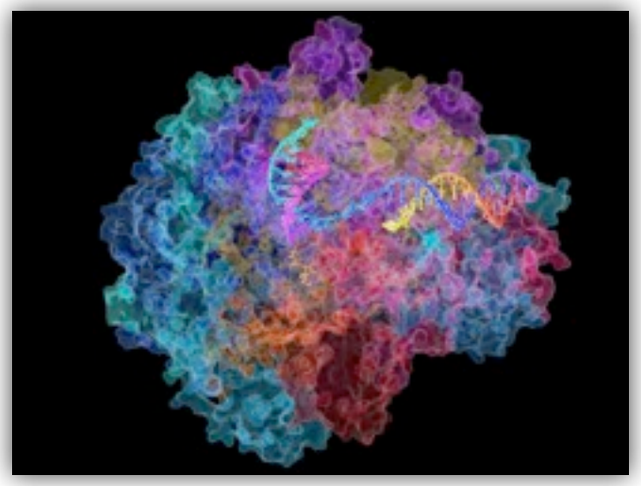
   Application to the Nup84 complex
3. Multiple fitting of subunits into an EM map of the whole assembly

   Application to the 26S proteasome

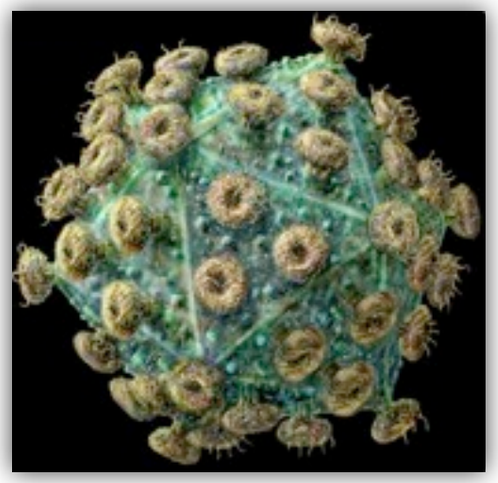
Structural biology:
Maximize accuracy, resolution, completeness, and efficiency of the structural coverage of macromolecular assemblies

Push the envelope: size, dynamics, heterogeneity.

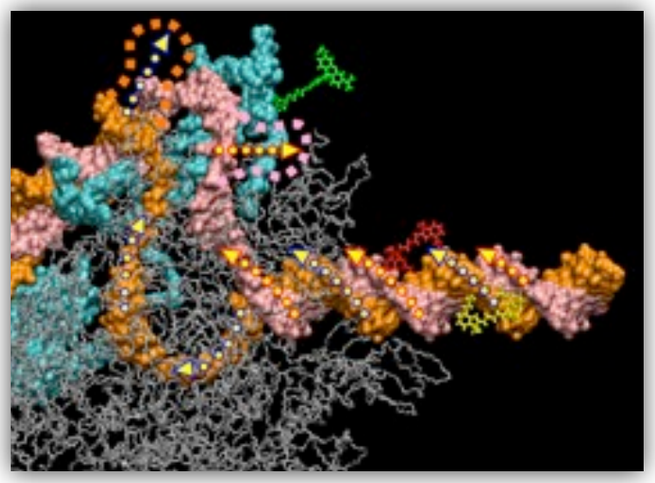
Motivation: Models will allow us to understand how machines work, how they evolved, how they can be controlled, modified, and perhaps even designed.



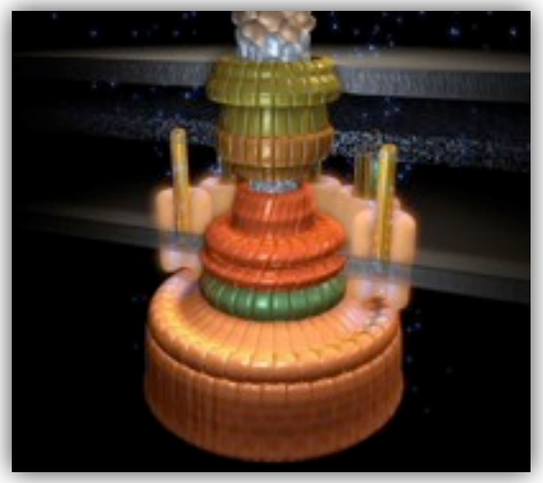
RNA polymerase II



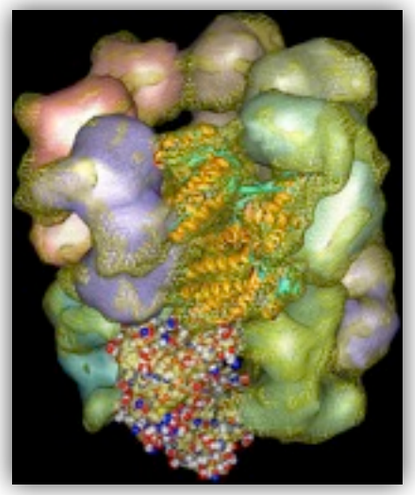
HIV virus



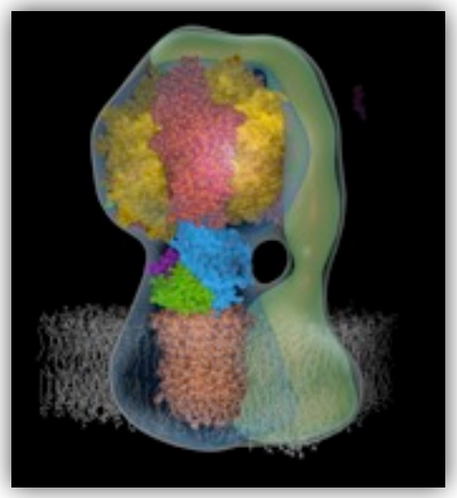
tRNA synthetase



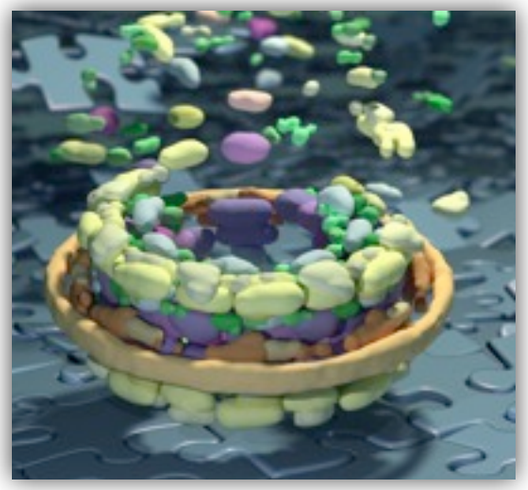
flagellar motor



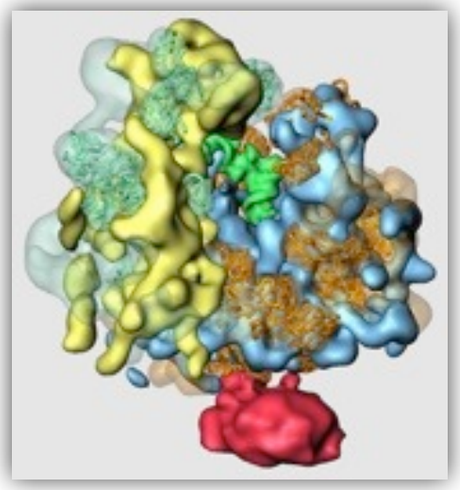
GroEL chaperonin



ATP synthase



nuclear pore complex



ribosome

There may be thousands of biologically relevant macromolecular complexes whose structures are yet to be characterized, involved in a few hundred core biological processes.

Integrative Structural Biology

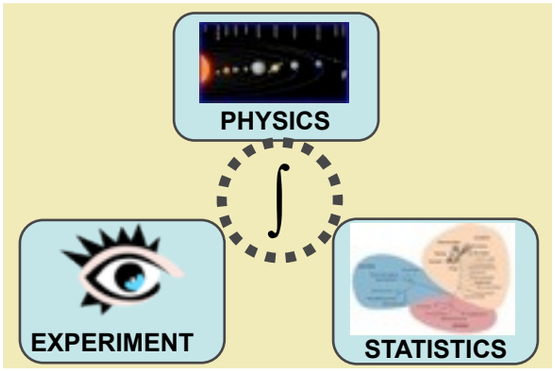
for maximizing accuracy, resolution, completeness, and efficiency of structure determination

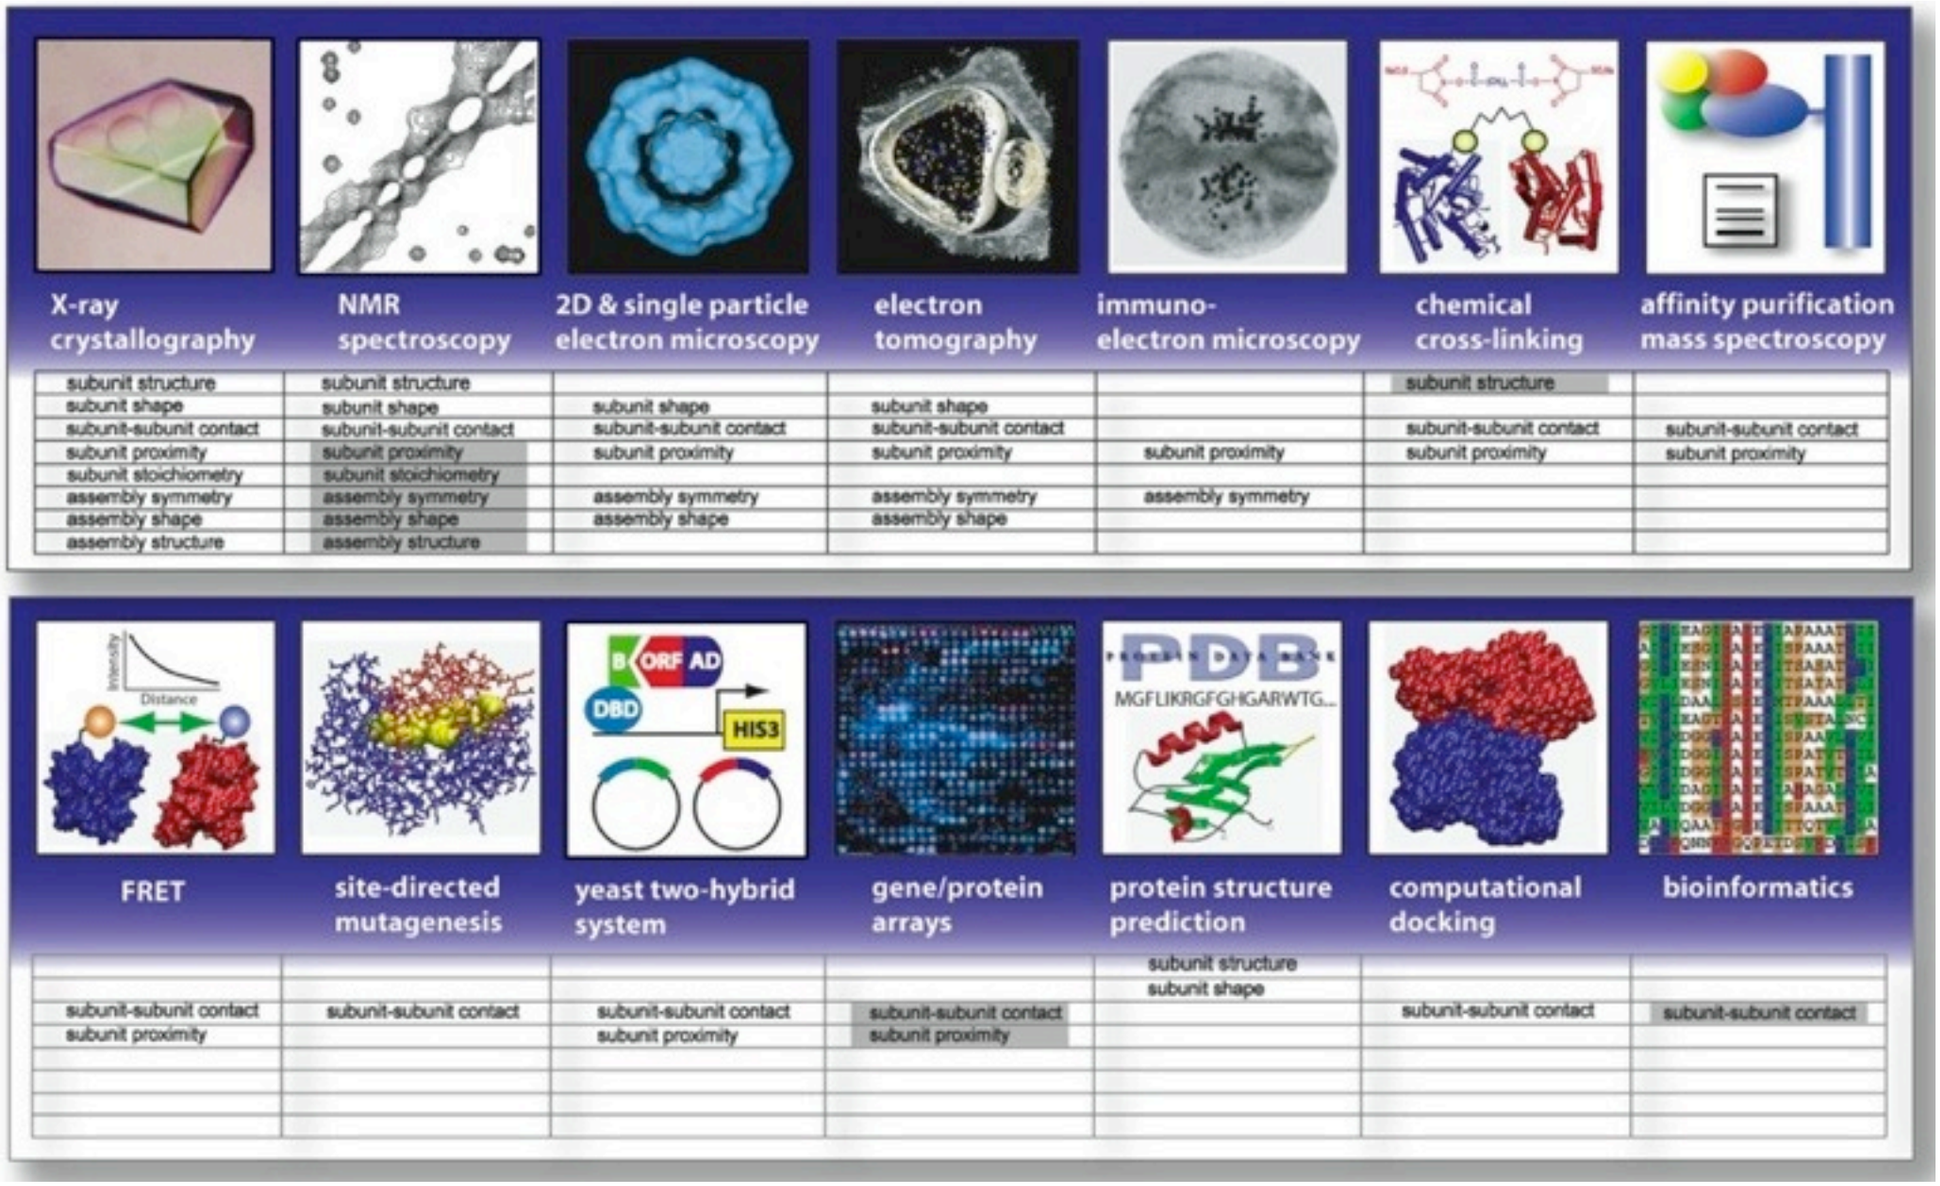
Use structural information from any

source: measurement, first principles, rules;

resolution: low or high resolution

to obtain the set of all models that are consistent with it.





Sali, Earnest, Glaeser, Baumeister. From words to literature in structural proteomics. *Nature* 422, 216-225, 2003.

An approach to integrative structural biology

Alber *et al*. *Nature* **450**, 683-694, 2007

Robinson, Sali, Baumeister. *Nature* **450**, 974-982, 2007

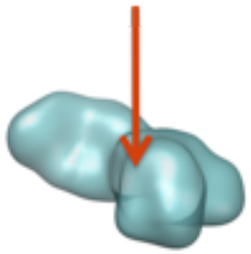
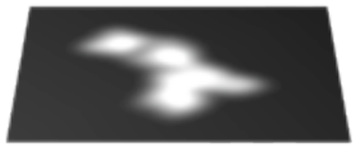
Scoring: Comparison of EM image and model

Velazquez *et al*. PNAS, 2012

model density

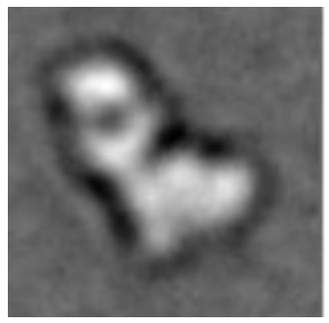


model projection



P(**m**,α)

Class average



d

Correlation between an image and closest model projection:

$$em2D = 1 - \max_{\alpha} corr(\mathbf{P}(\mathbf{m},\alpha),\mathbf{d})$$

- An EM image (*eg*, class average) **d** is compared with the most overlapping projection **P**(**m**,α) of a downsampled model **m**.
- This optimal projection is found by optimization over three orientation angles and two translation distances, α.
- Can be easily extended to tilt series of images to improve data-to-parameter ratio.
- It may be possible to address conformational and configurational homogeneity.

Scoring: Comparison of EM image and model

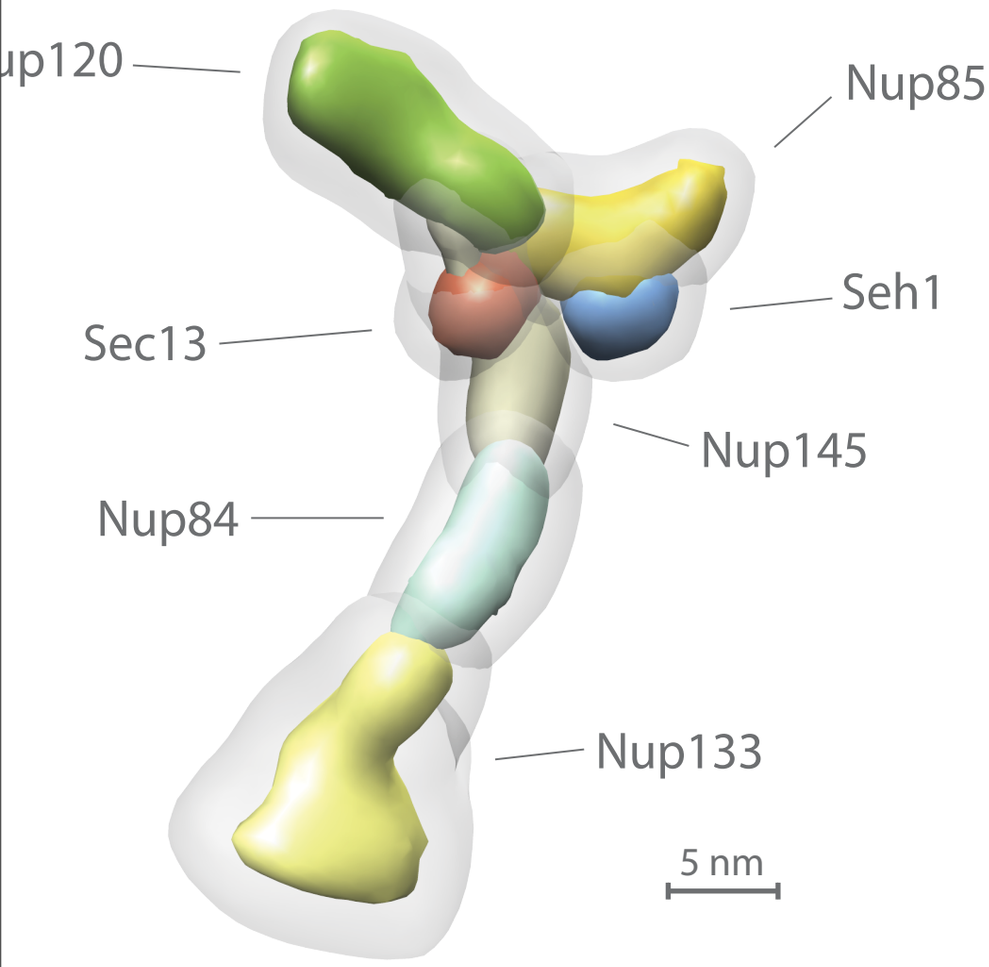
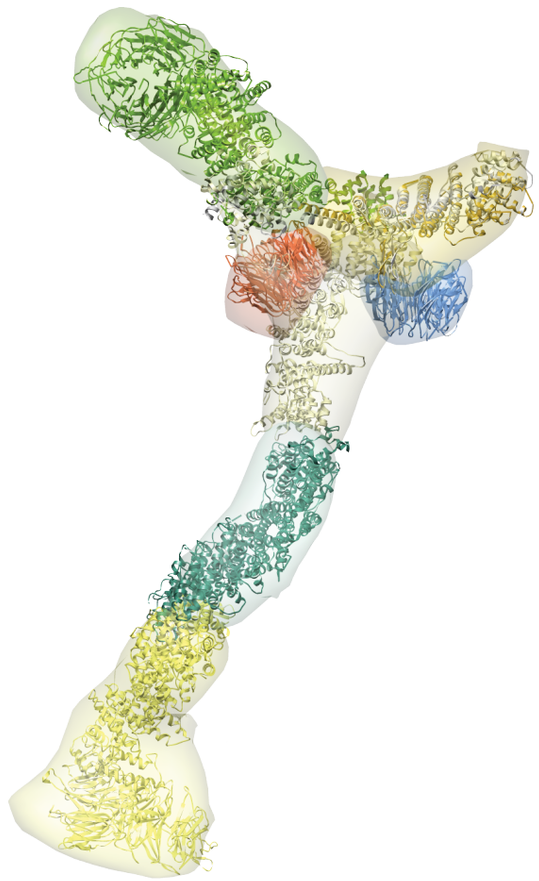
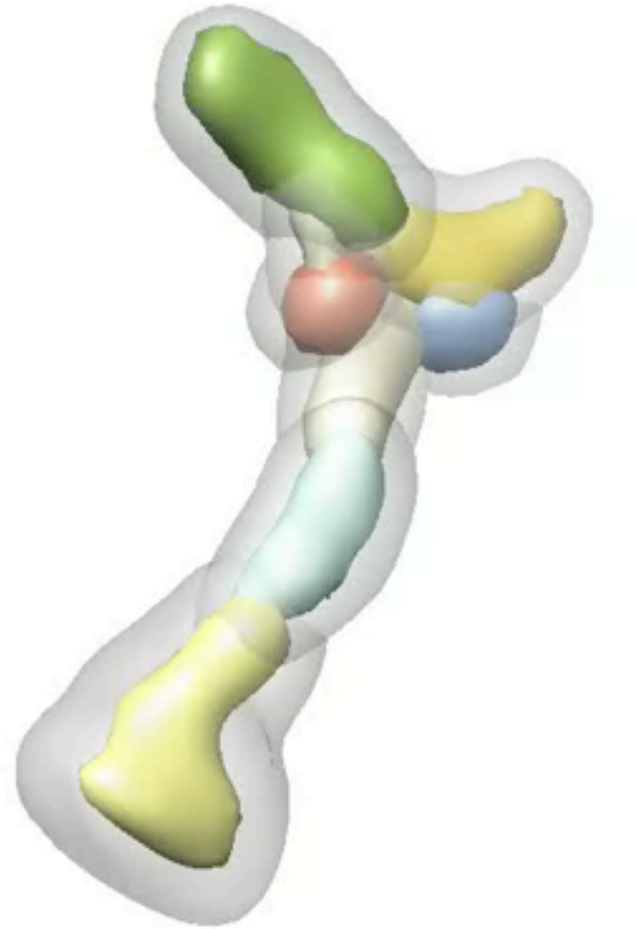
Yeast Nup145

Nup84 complex:
Ensemble of good scoring solutions

Fernandez, Phillips, ... Stokes, Chait, Rout. JCB, 2012

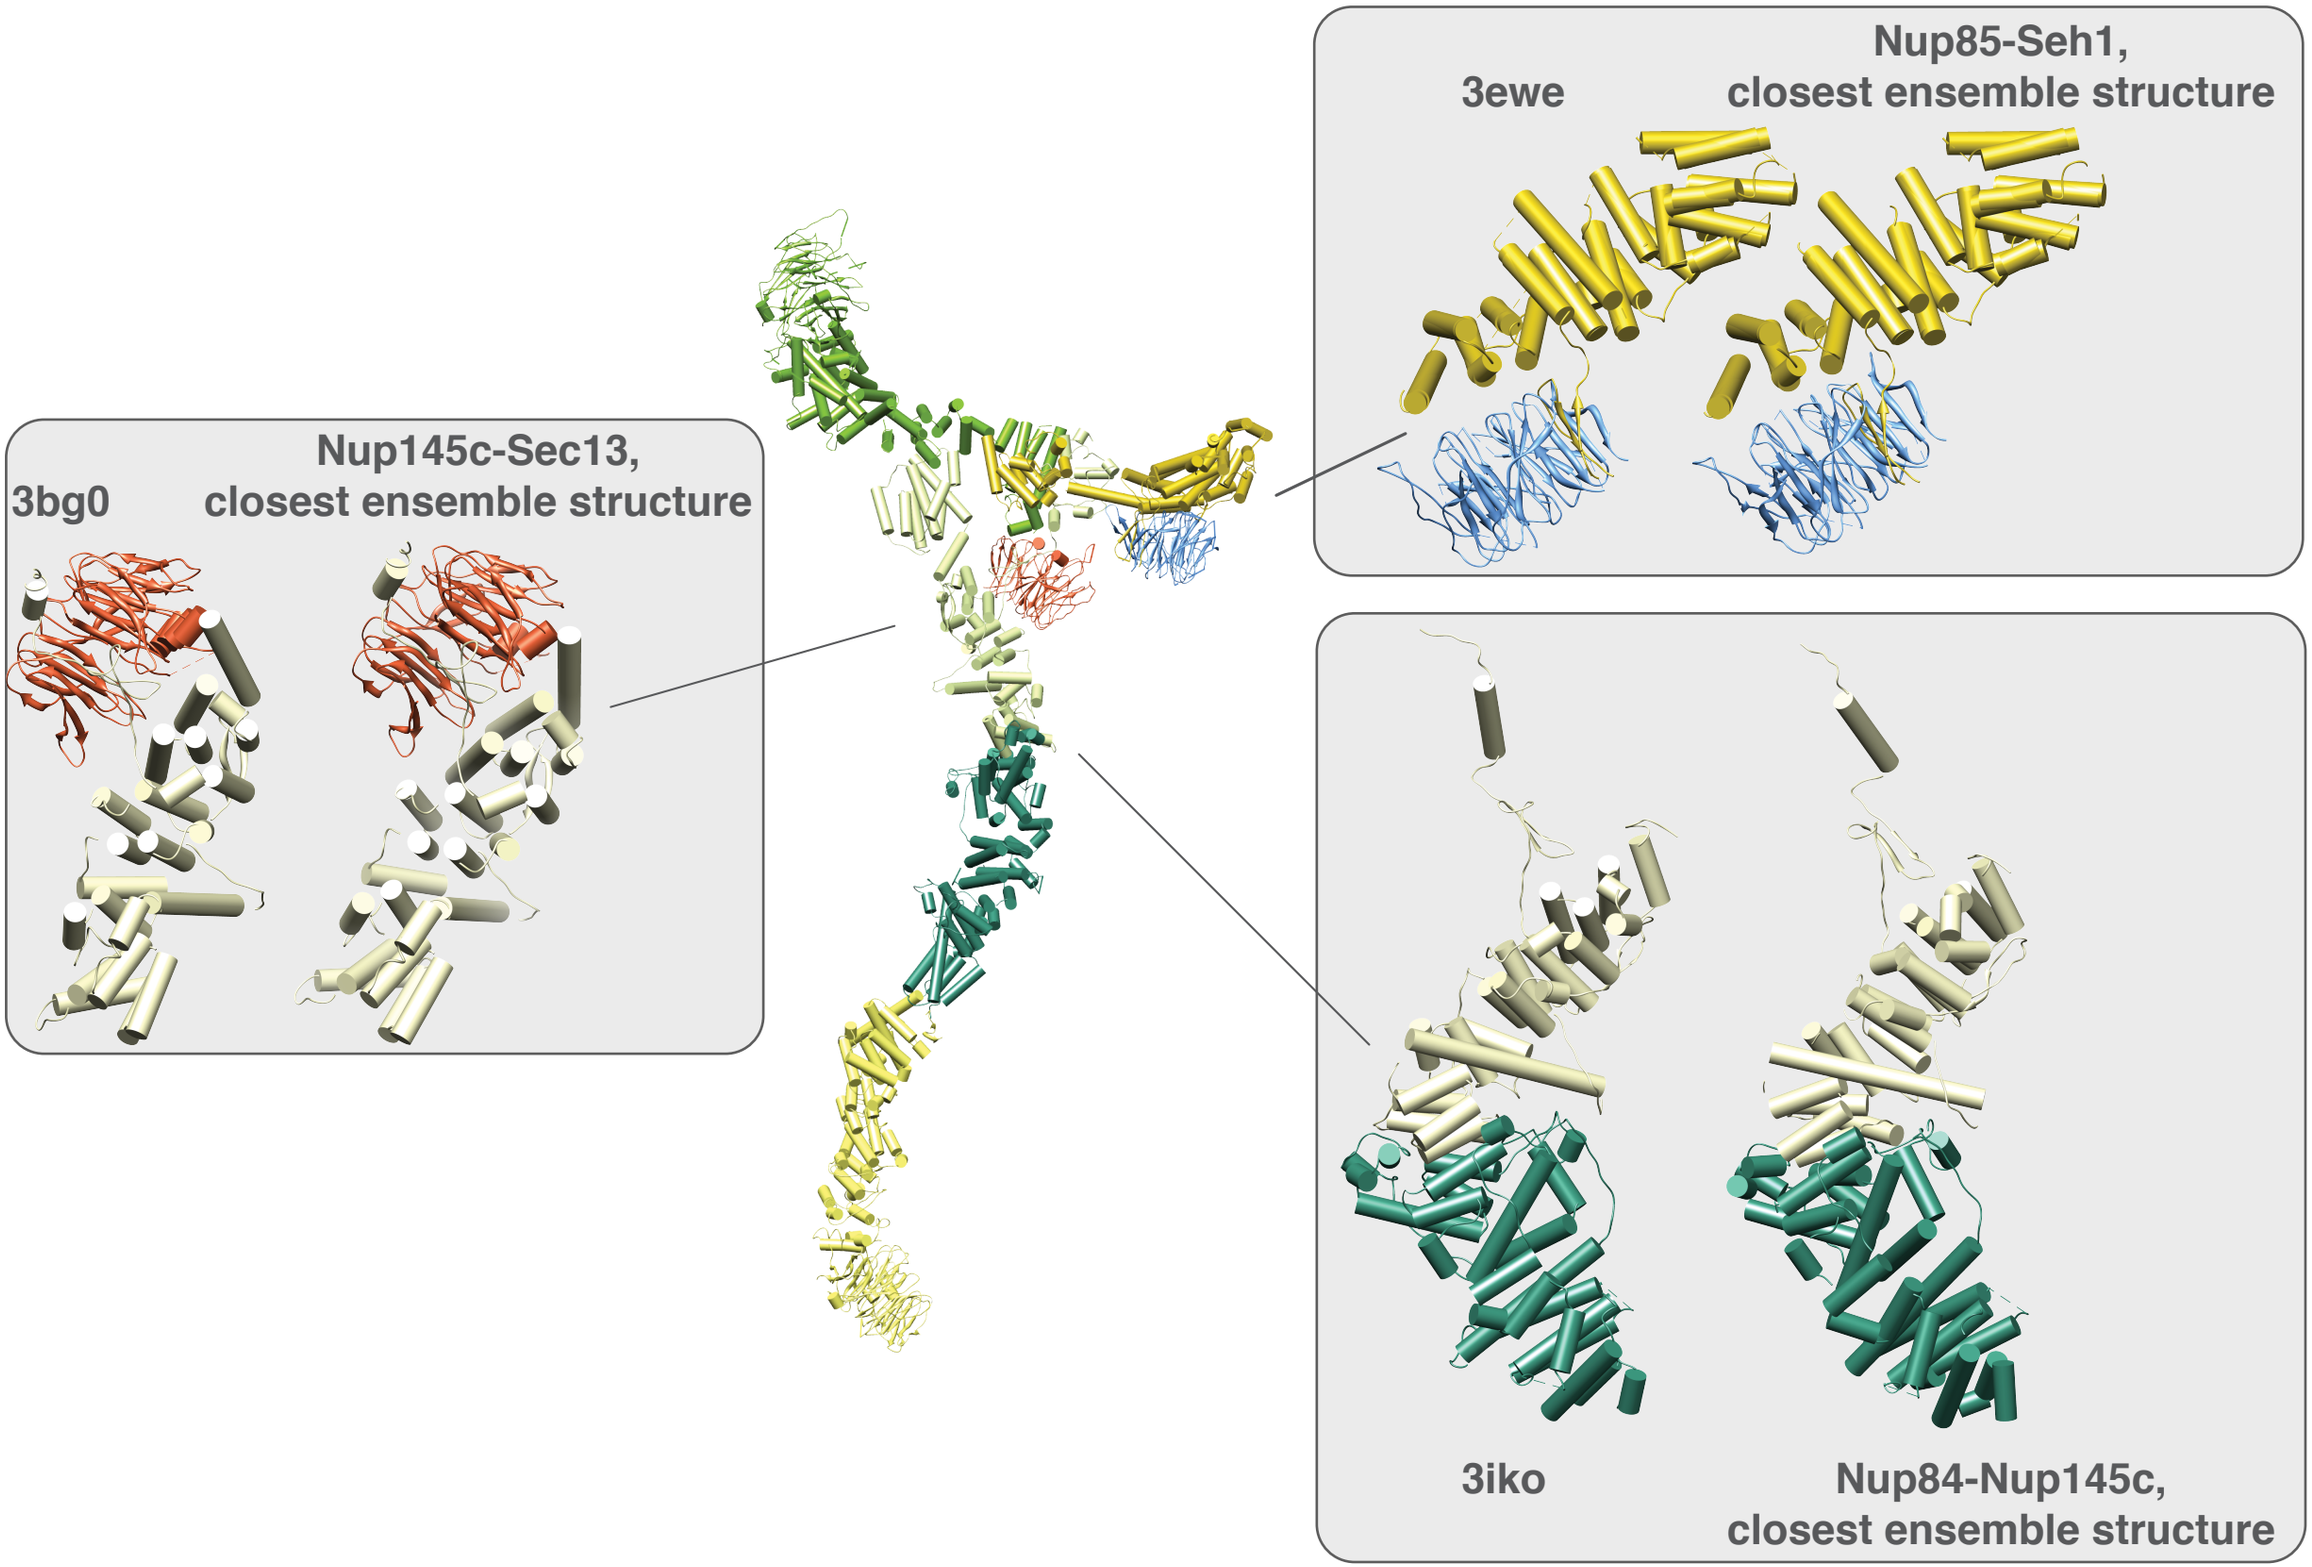






- 10,000 good scoring structures
- All restraints are satisfied (2D-EM, domain deletion, ...)
- Domain-domain orientations are resolved uniquely.
- Full ensemble precision is ~1 nm

Assessment: Agreement with heterodimeric crystallographic structures



Contents

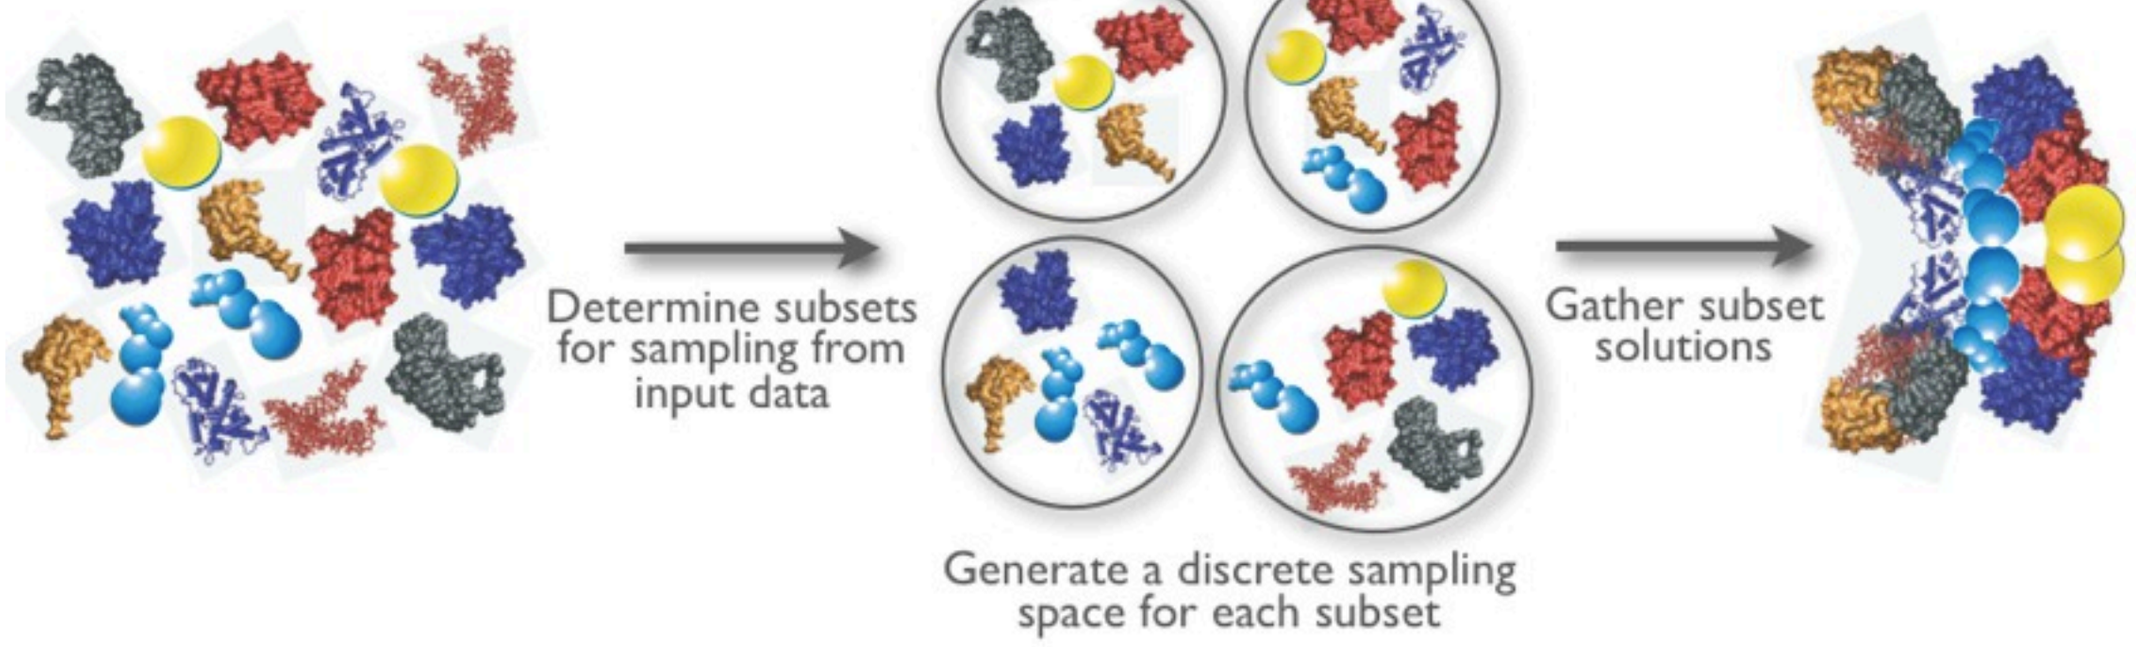
1. Integrative (hybrid) structure determination
2. EM images as a source of spatial restraints

   Application to the Nup84 complex
3. Multiple fitting of subunits into an EM map of the whole assembly

   Application to the 26S proteasome

Sampling

Divide-and-conquer sampling



M.I. Jordan, Graphical models. *Stat. Sci*. **19**, 140–155, 2004.
K. Lasker, M. Topf, A. Sali, **H. Wolfson**, J. Mol. Biol. 388, 180-194, 2009.

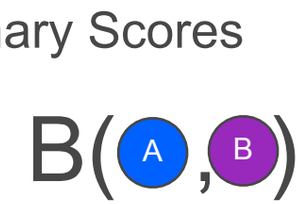
Divide-and-conquer sampling in IMP

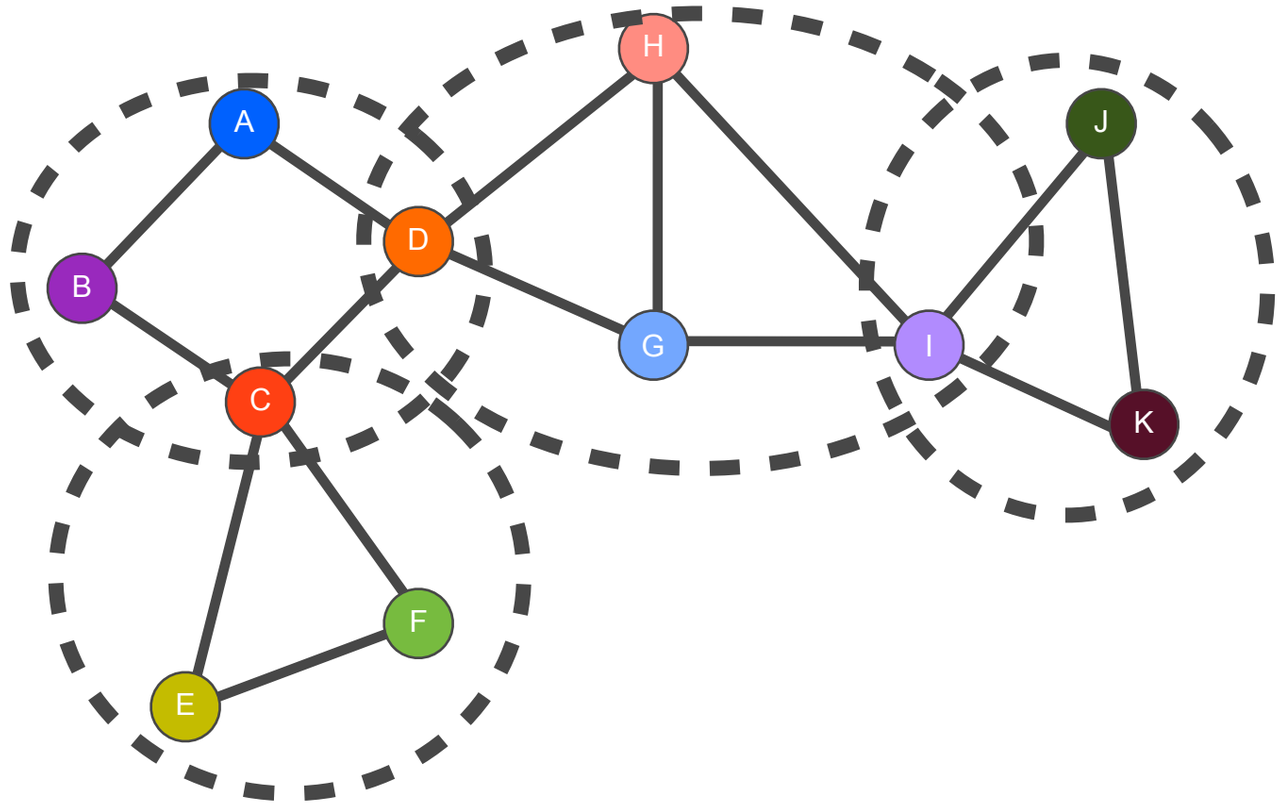
K. Lasker, D. Russel, B. Webb

System components

Unary Scores

Binary Scores

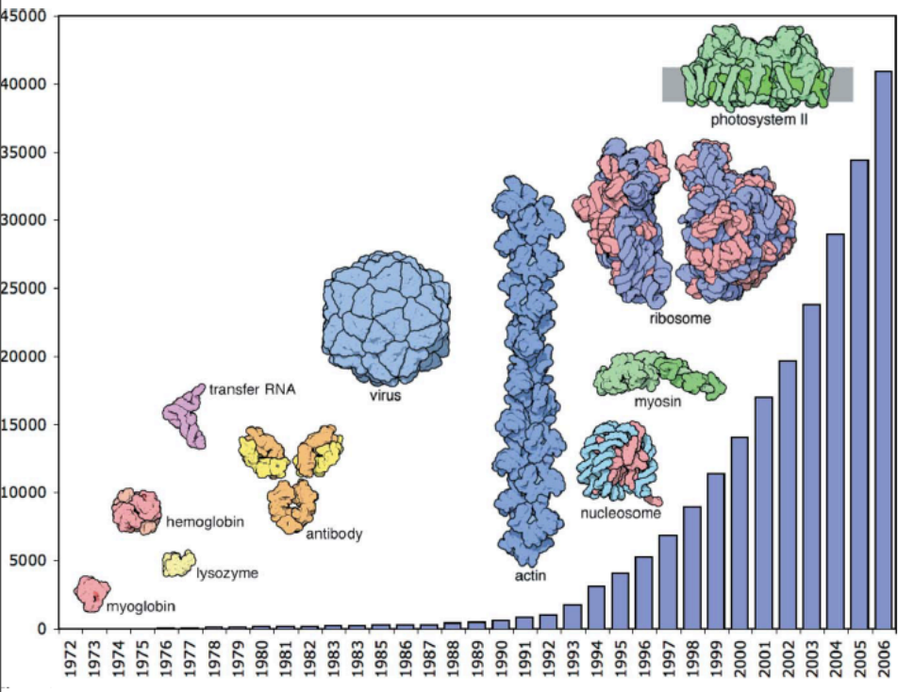




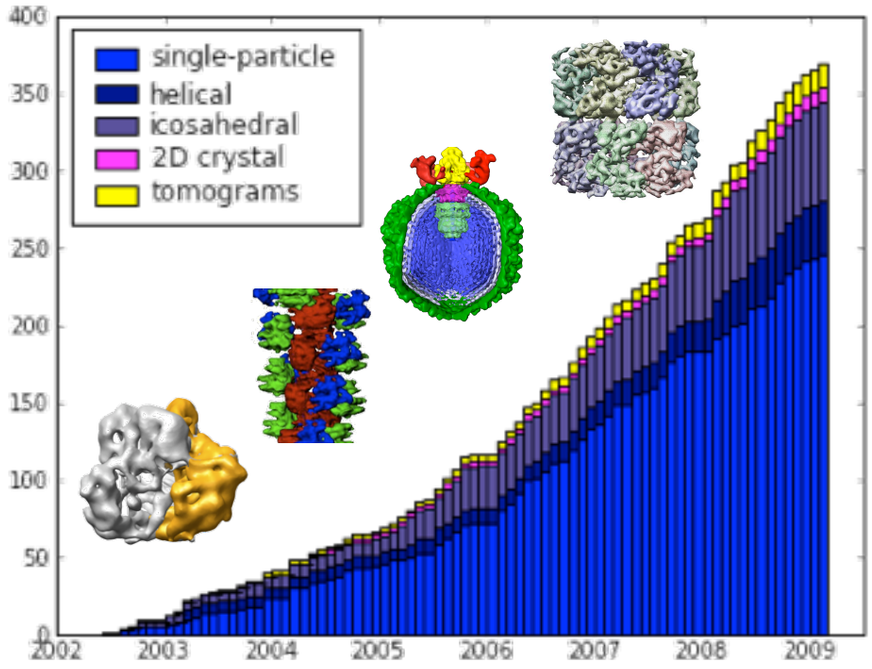
1. discretize the sampling space,
2. break the system into overlapping subsets,
3. find acceptable local solutions,
4. then merge them together self-consistenly into increasingly larger subsets.

Assembly architecture from atomic structures of subunits, EM density map of assembly, and proteomics

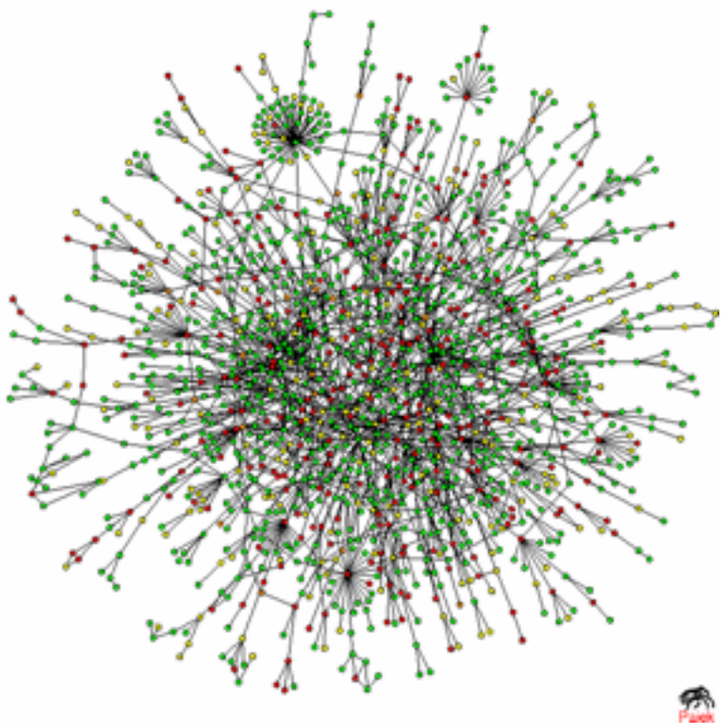
Protein Data Bank



EM Data Bank



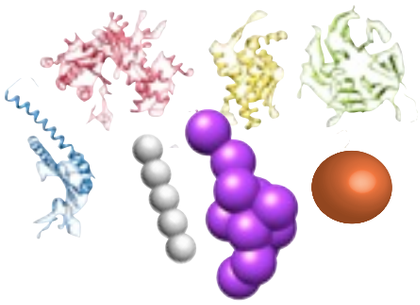
BioGrid, ...



Aligning proteomics networks to EM density maps

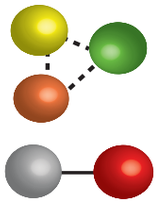
Lasker et al. *J. Mol. Biol*. 388, 180-194, 2009
Lasker et al. *in preparation*

Input: components, map, interactions



component sequences

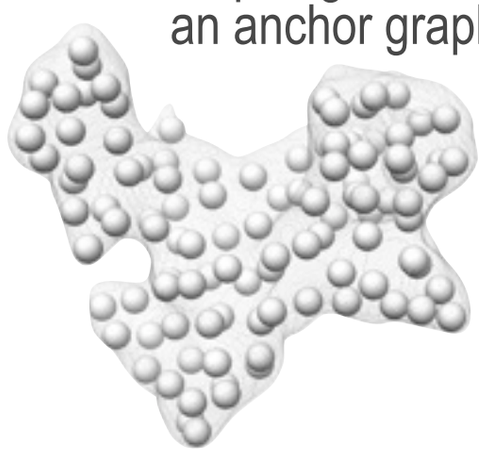
assembly map



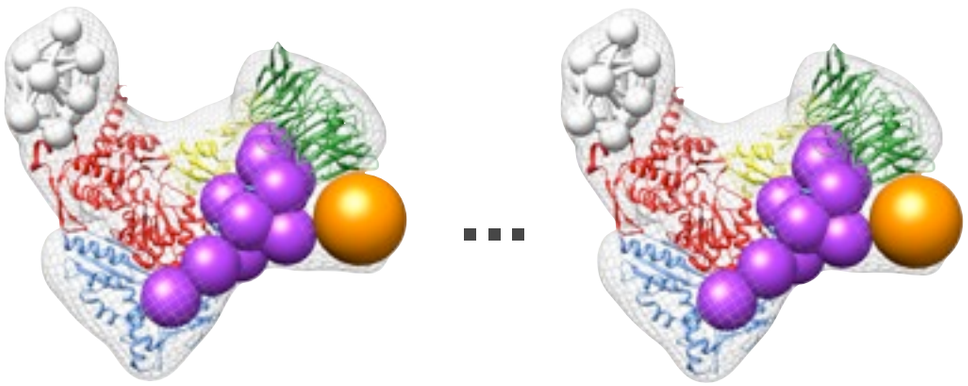
contacts, proximities

Discretize map

Map segmented into an anchor graph

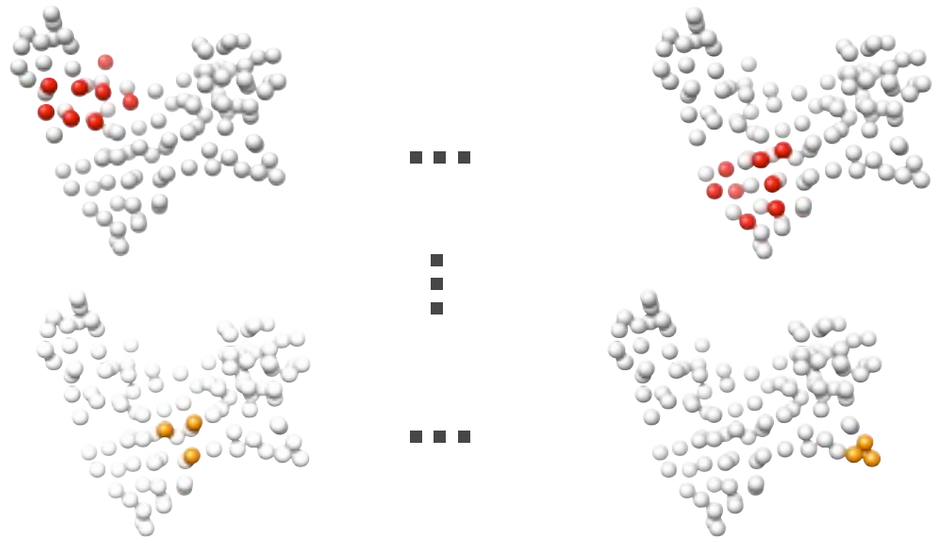


Build a discrete sampling space



Output: Enumerated best-scoring configurations

Assemble partial solutions



Positions of a component with known atomic structures are searched by rigid body fitting; Positions of a component without a known atomic structure are found by path search

Contents

1. Integrative (hybrid) structure determination
2. EM images as a source of spatial restraints

   Application to the Nup84 complex
3. Multiple fitting of subunits into an EM map of the whole assembly

   Application to the 26S proteasome

Molecular architecture of the 26S proteasome holocomplex determined by an integrative approach

Keren Lasker, Friedrich Förster, Stefan Bohn, Thomas Walzthoeni, Elizabeth Villa, Pia Unverdorben, Florian Beck, **Ruedi Aebersold**, Andrej Sali, and **Wolfgang Baumeister**. ***Proc. Natl. Acad. Sci. USA***, 2012.

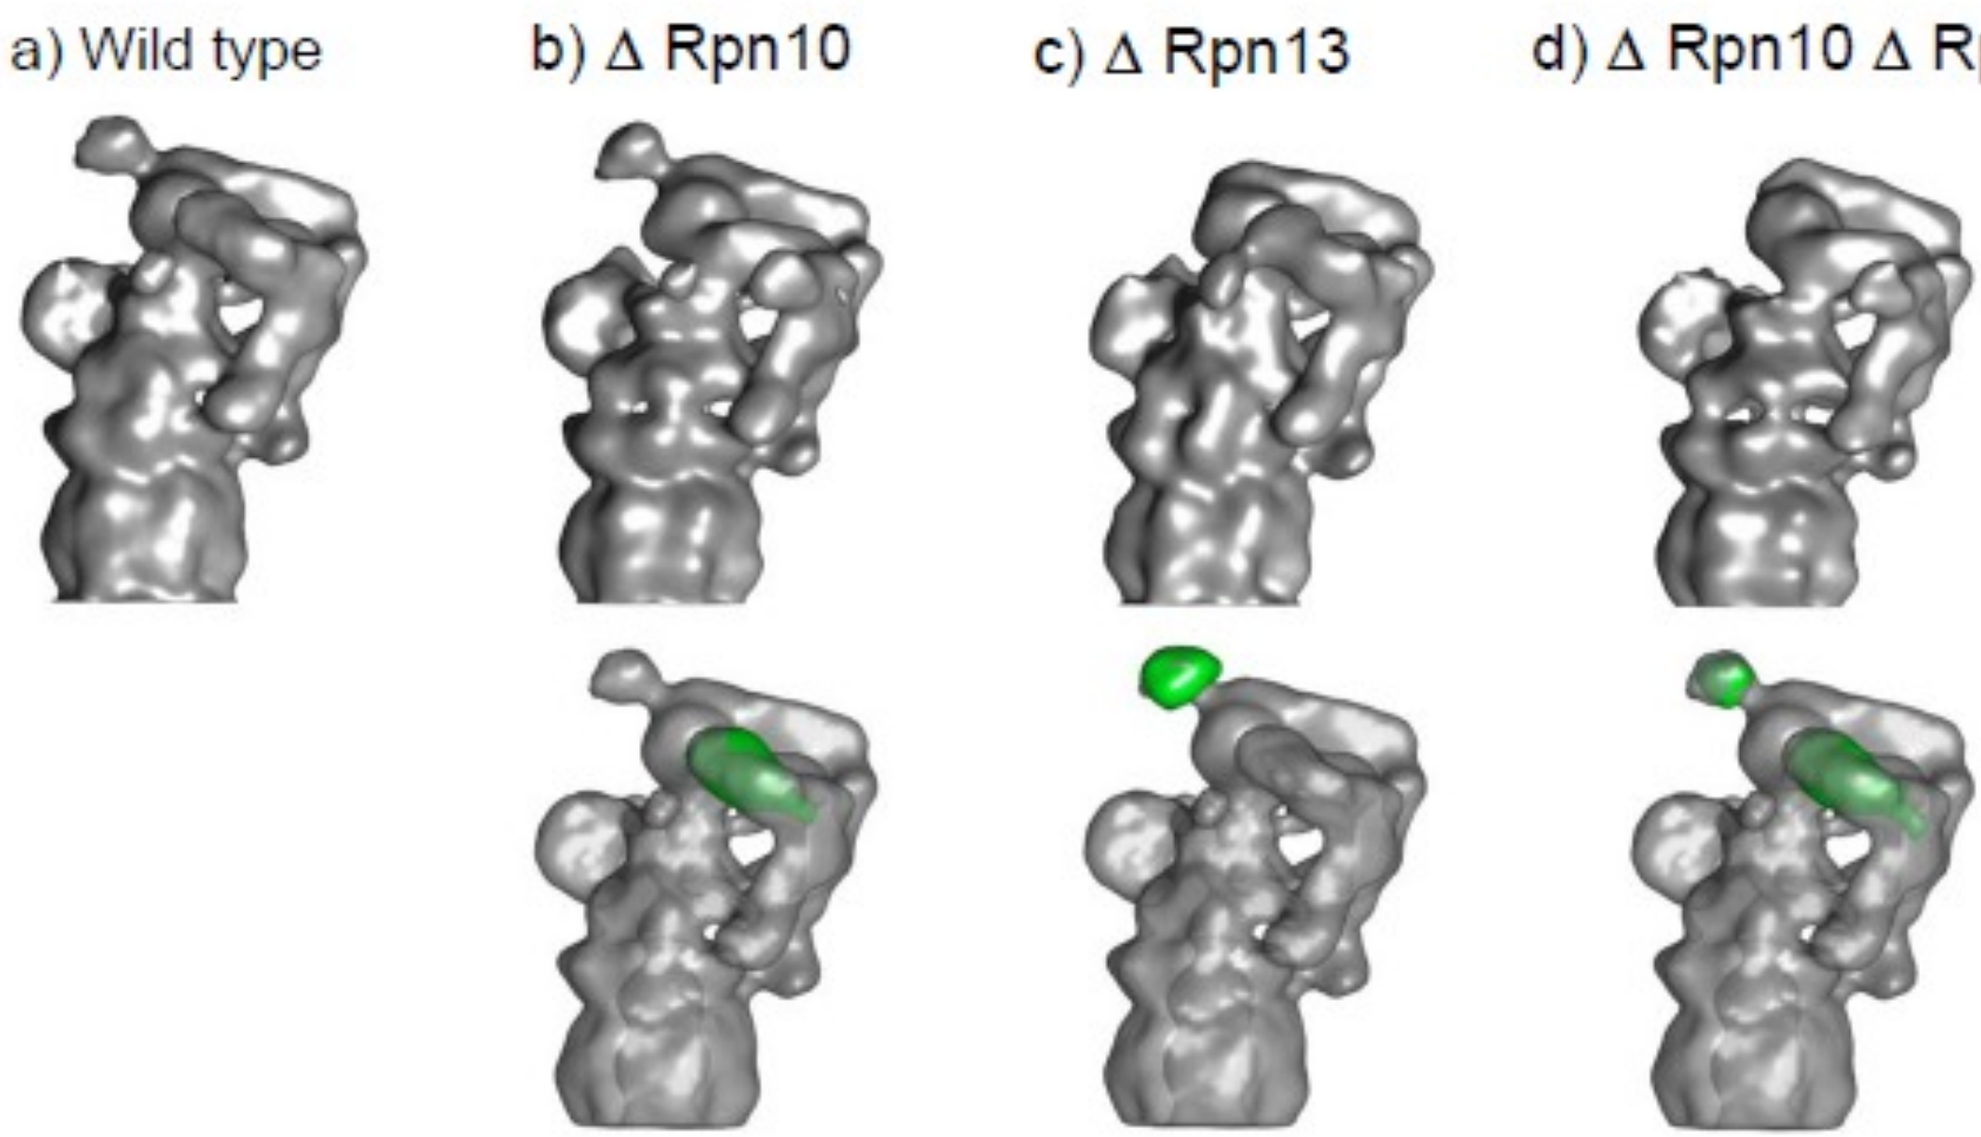
Increment	0.5°
FSC @ 0.5	8.4 Å
FSC @ 0.3	7.1 Å

Restraints: Cross-correlation between a model and the map

F. Foerster, S. Bohn, W. Baumeister

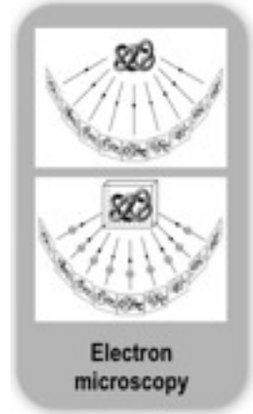
Cryo-EM of knockout mutants localizes Rpn10 and Rpn13

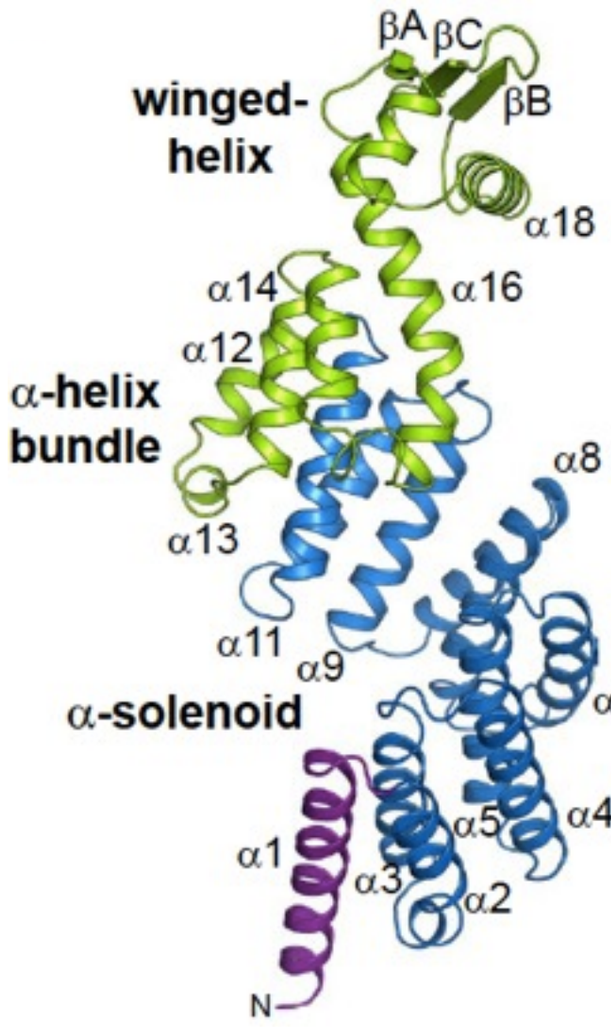


Restraints: Positions of Rpn10 and Rpn13 are fixed while sampling other subunits.

Sakata S, Bohn S, Mihalache O, Kiss P, Beck F, Nagy I, Nickell S, Tanaka K, Saeki Y, Förster F, Baumeister W, ***PNAS***, 2012.

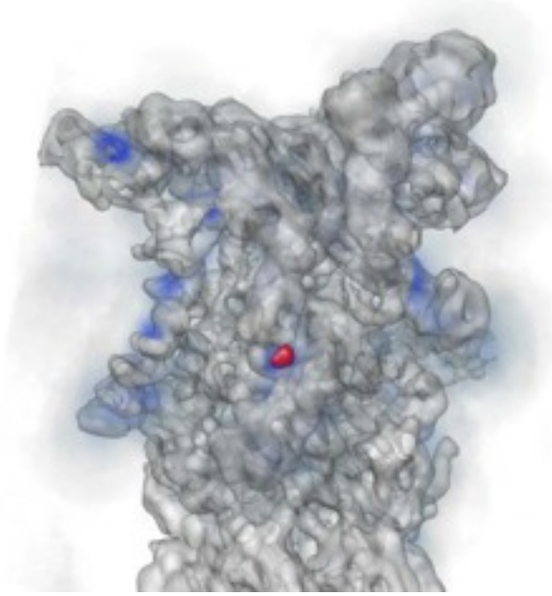
Fitting of *D. melanogaster* Rpn6 X-ray structure into the cryo-EM map localizes Rpn6

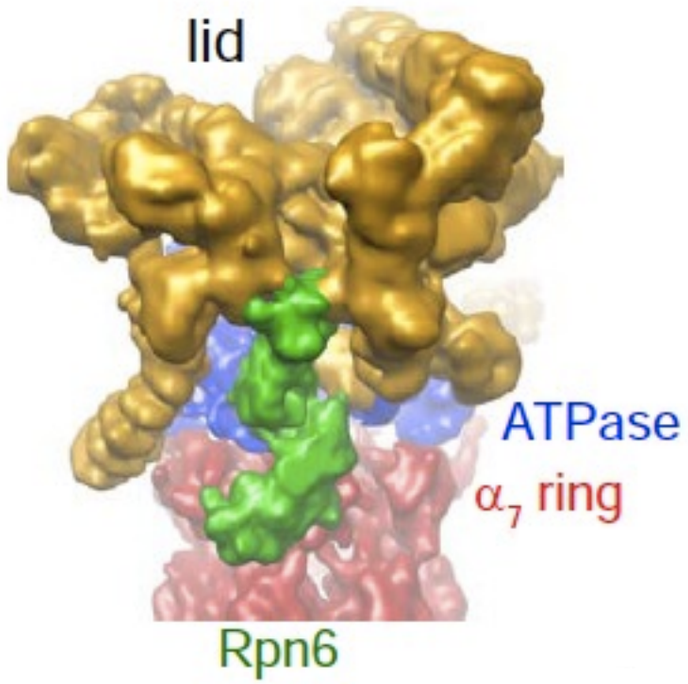




Pathare GR, Nagy I, Bohn S, Unverdorben P, Hubert A, Körner R, Nickell S, Lasker K, Sali A, Tamura T, Nishioka T, Förster F, Baumeister W & Bracher A., ***PNAS***, 2012.

Structure - map cross-correlation

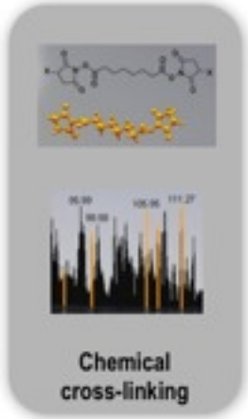




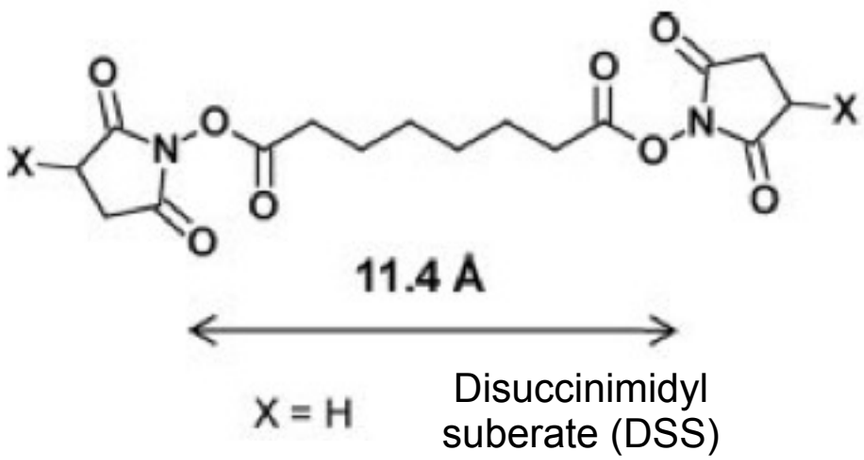
Restraints: Position of Rpn6 is fixed while sampling other subunits.

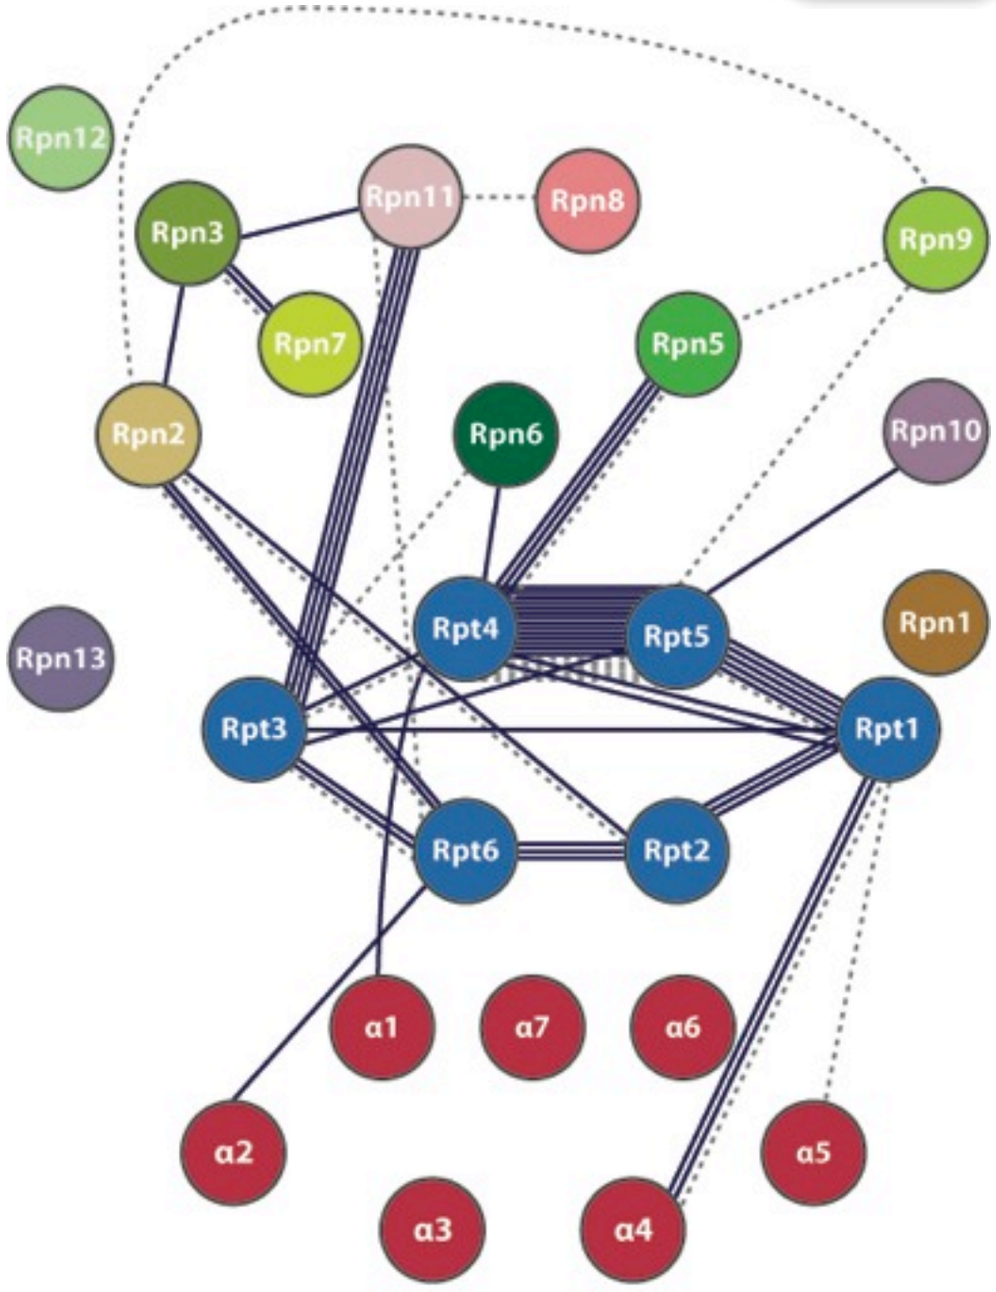
Similarly, for the AAA-ATPase Rtp1-6 heteromeric ring (Bohn *et al*, ***PNAS***, 2010)**.**

Cross-linking / mass spectrometry data



Leitner, Walzthoeni, Kahraman, Herzog,
Rinner, Beck, Aebersold. ***MCP***, 2010





Inter-molecular cross-linking of exposed Lys residues:

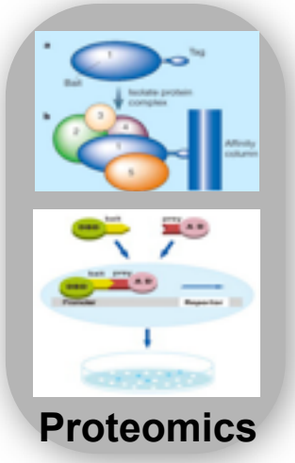
- 12 Rpt-Rpn residue-specific crosslinks (*S.p.*)
- 3 Rpn-Rpn residue-specific crosslinks (*S.p.*)

Restraints: upper distance bounds on cross-linked atoms or beads.

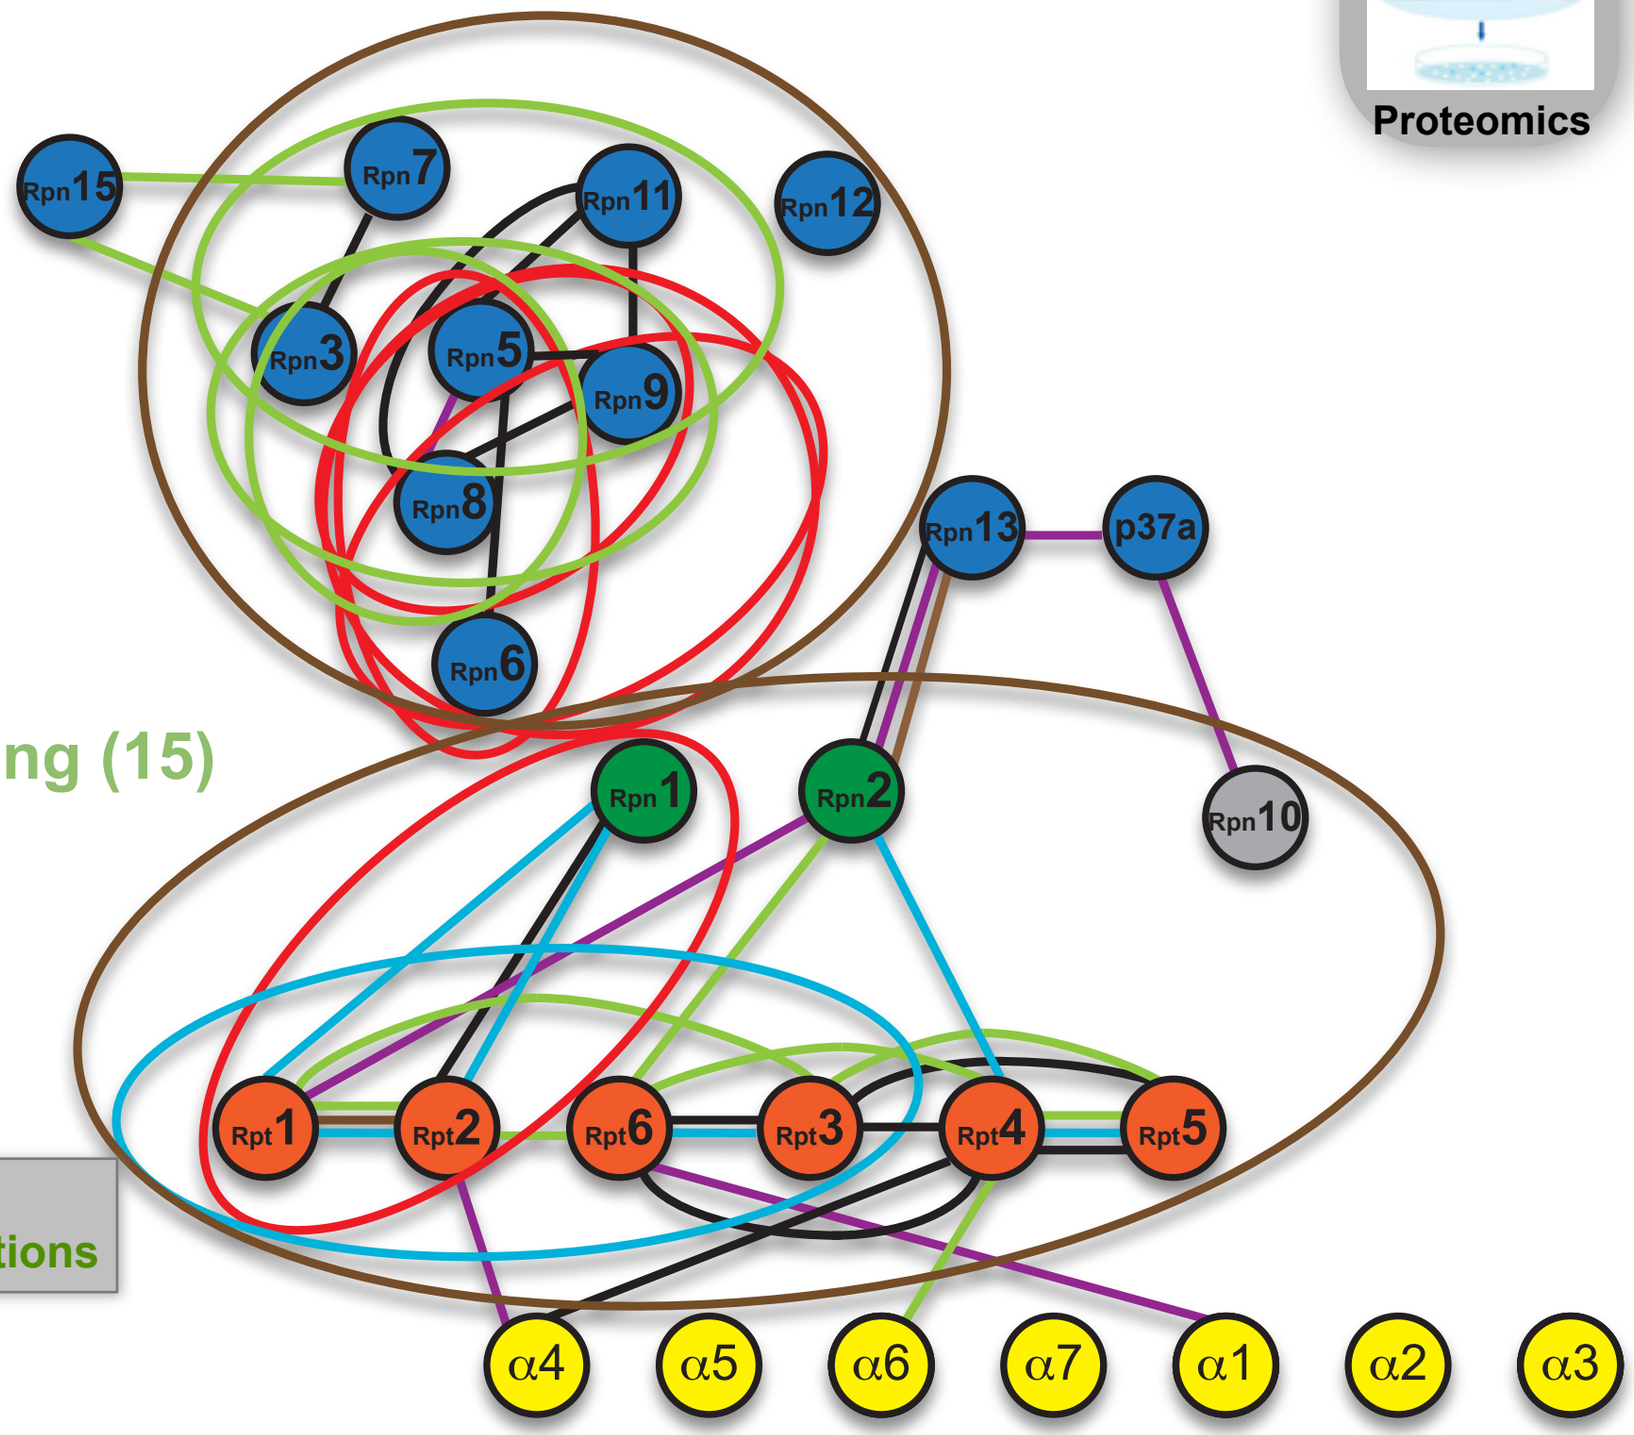
***S.p.* cross-links**
S.c. cross-links

T. Walzthoni, A. Leitner,
M. Beck, R. Aebersold

Public proteomics data

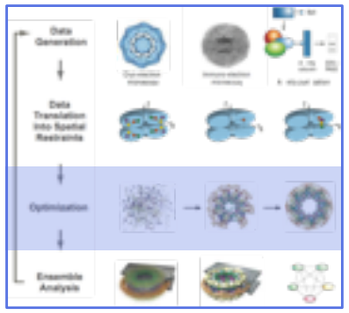


- Two Hybrid (16)
- Pulldown (10)
- Co-Purification (4)
- MS-MS (4)
- Chemical Cross-Linking (15)
- Filter Binding (14)



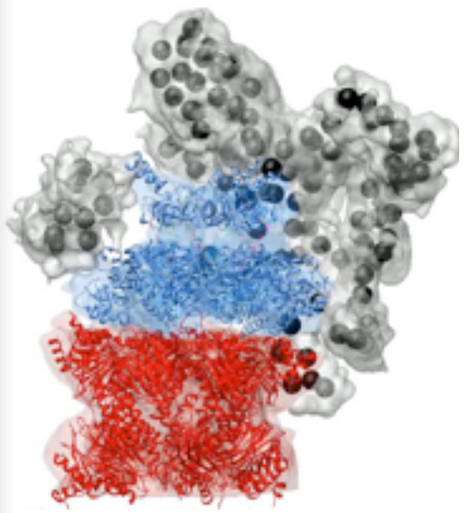
Restraints: connectivity restraints for coarse subunit representations

Förster F, Lasker K, Nickell S, Sali A, and Baumeister W, ***Mol. Cell. Proteomics,*** 2010
Stengel F, Robinson, C.



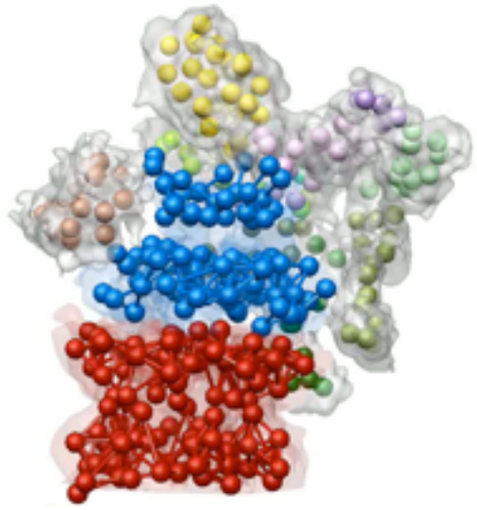
Sampling good-scoring 19S structures

Discretization



discretization of the map into 238 anchor points

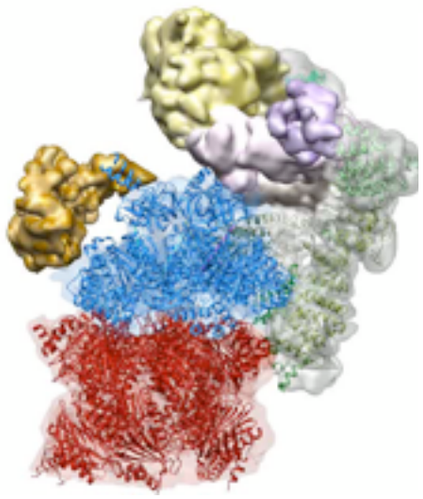
Localization



localization of coarse subunit models, subject to proteomics data

enumeration of all configurations with at most 5 violations

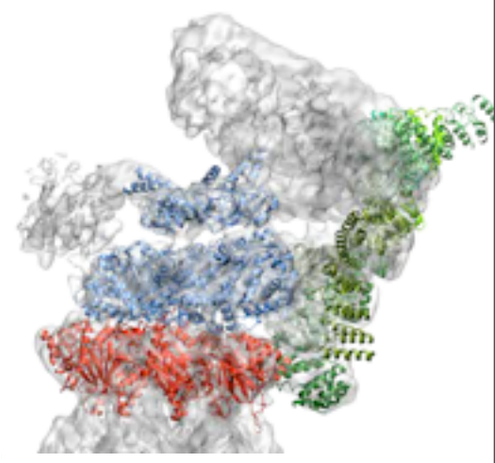
Fitting



local rigid body fitting of alternative atomic subunit models

selection of best subunit models by fitting quality

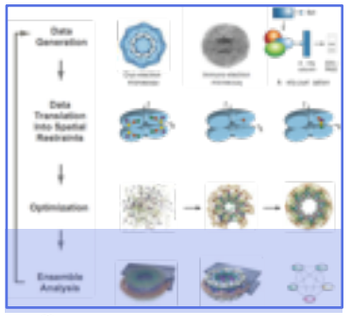
Refinement



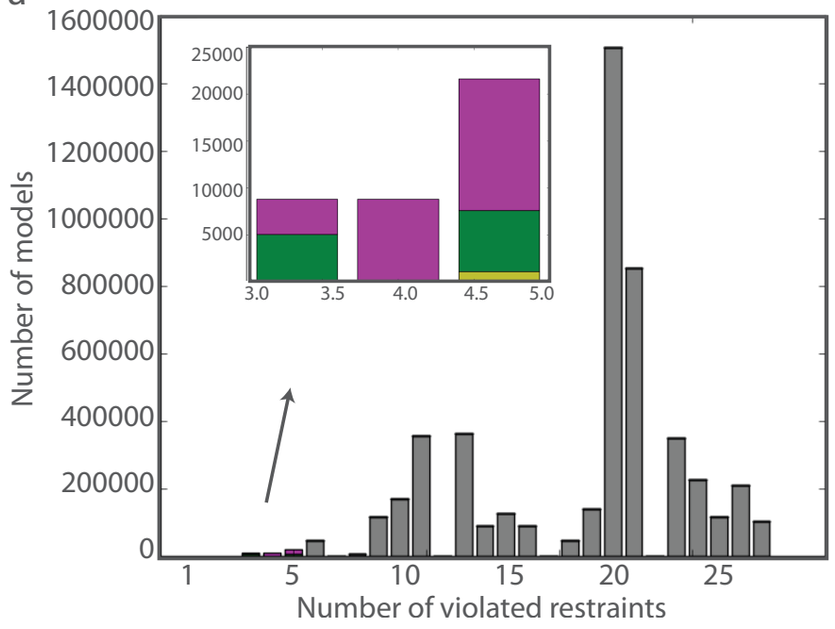
atomic model refinement subject to cross-linking and position restraints

Elizabeth Villa

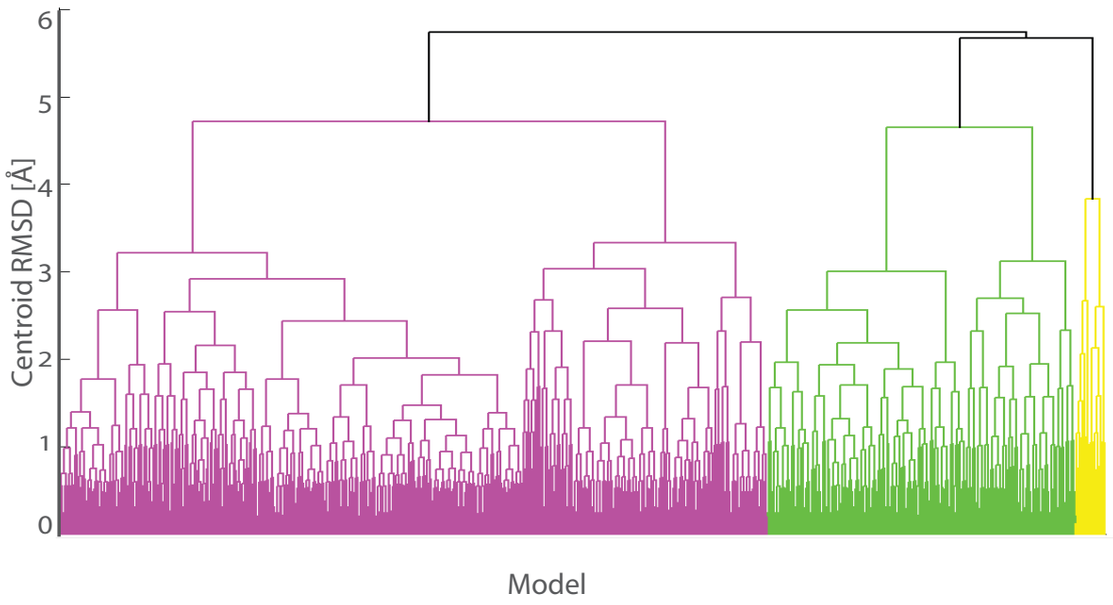
Ensemble of ~0.5 million best-scoring models



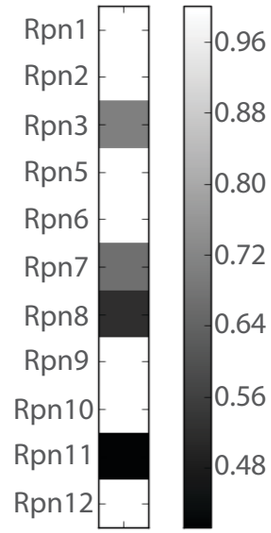
a



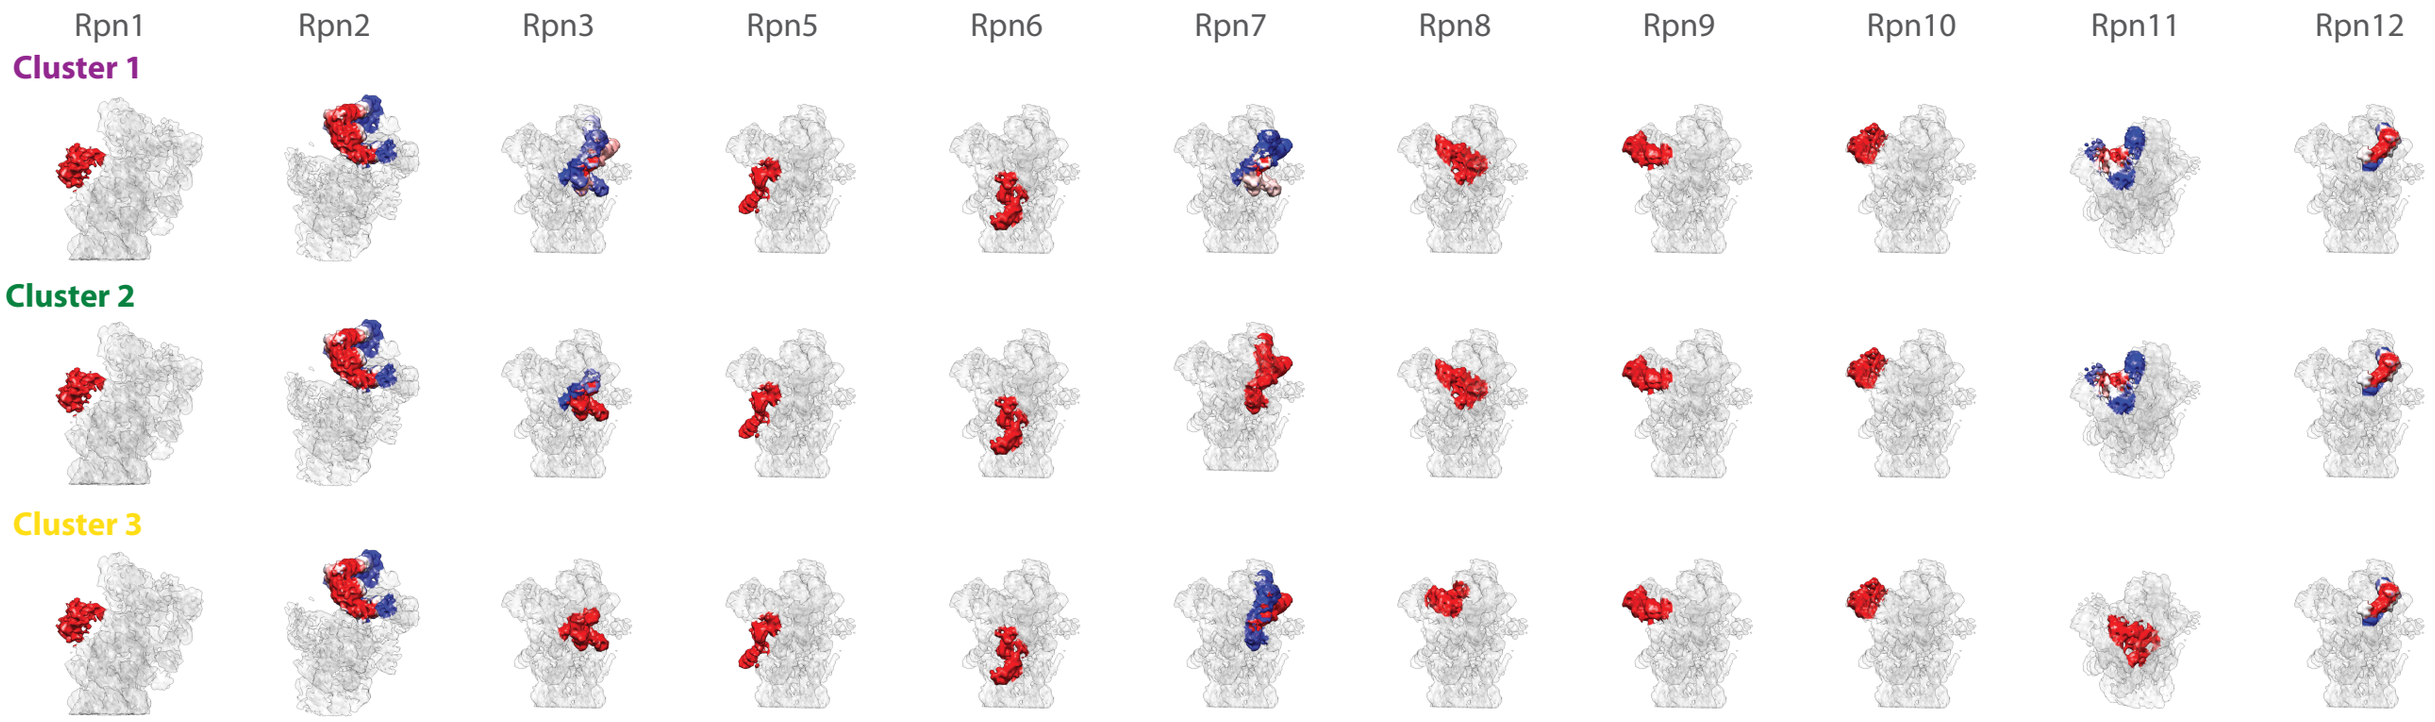
b



c



d



Assessing the well-scoring models

(in the absence of Bayesian inference)

1. Existence of a good-scoring model.

2. Precision of the ensemble of good-scoring models.

3. Check model against unused data (cross-validation).

4. Known precision / accuracy for “similar” cases.

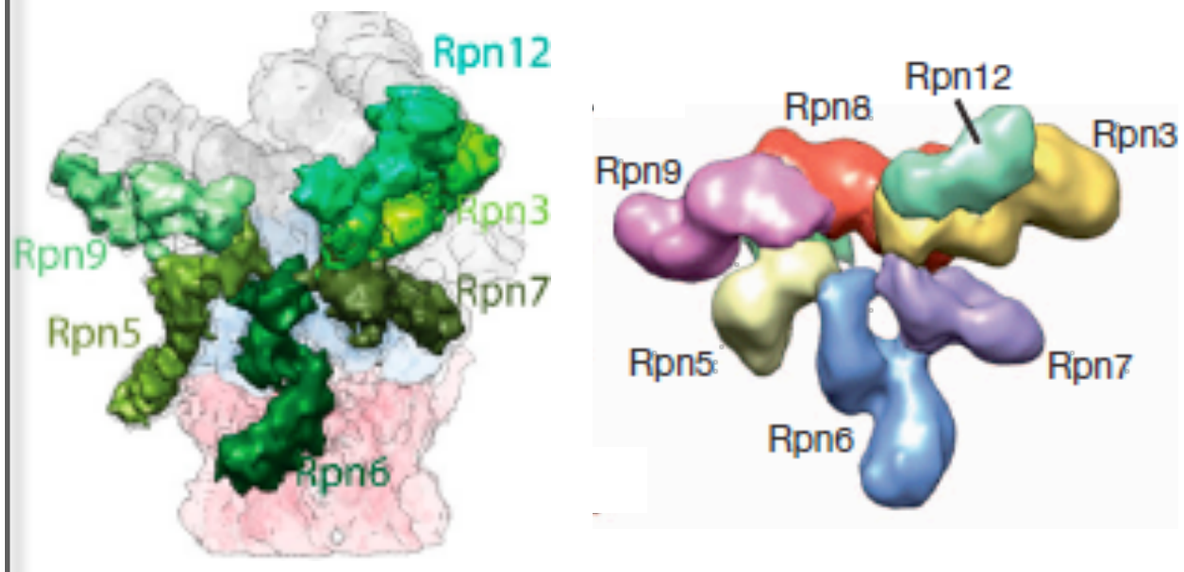
5. Non-random patterns in the model.

Modeling facilitates assessing the data as well as models in terms of precision and accuracy.

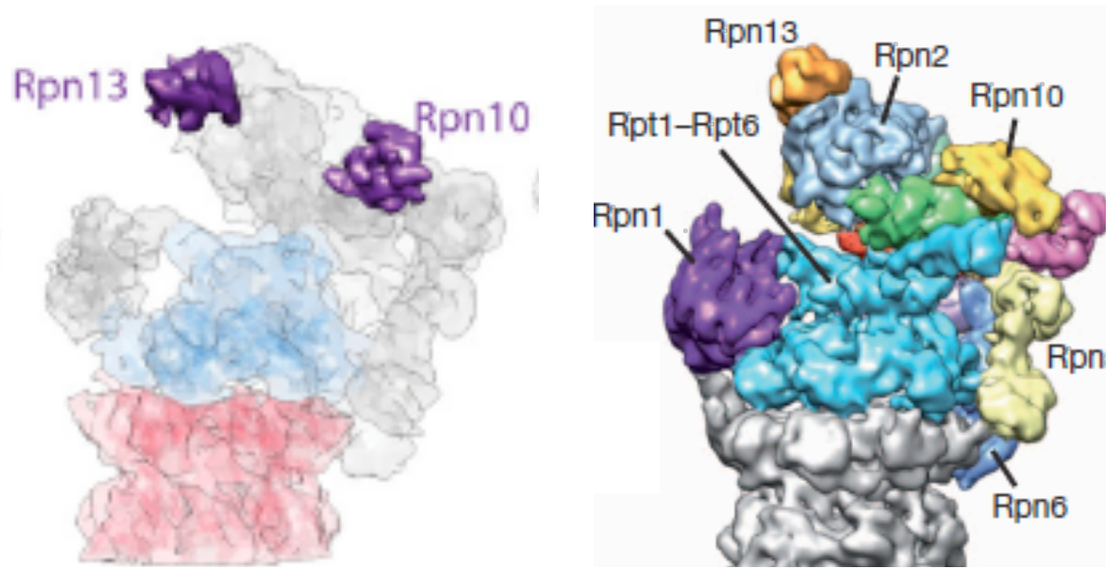
Comparison with an independently determined model

Left: Lasker, Förster, Bohn, Walzthoeni, Villa, Unverdorben, Beck, Aebersold, Sali, Baumeister. ***PNAS***, 2012.
Right: Lander, Estrin, Matyskiela, Bashore, Nogales, Martin. ***Nature***, 2012.

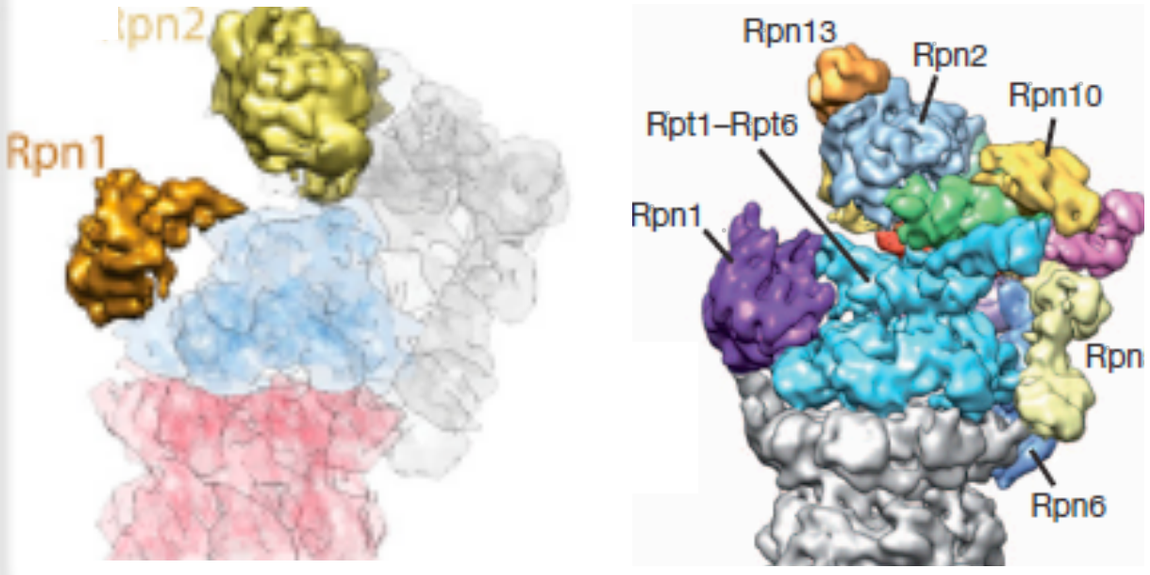
PCI containing proteins



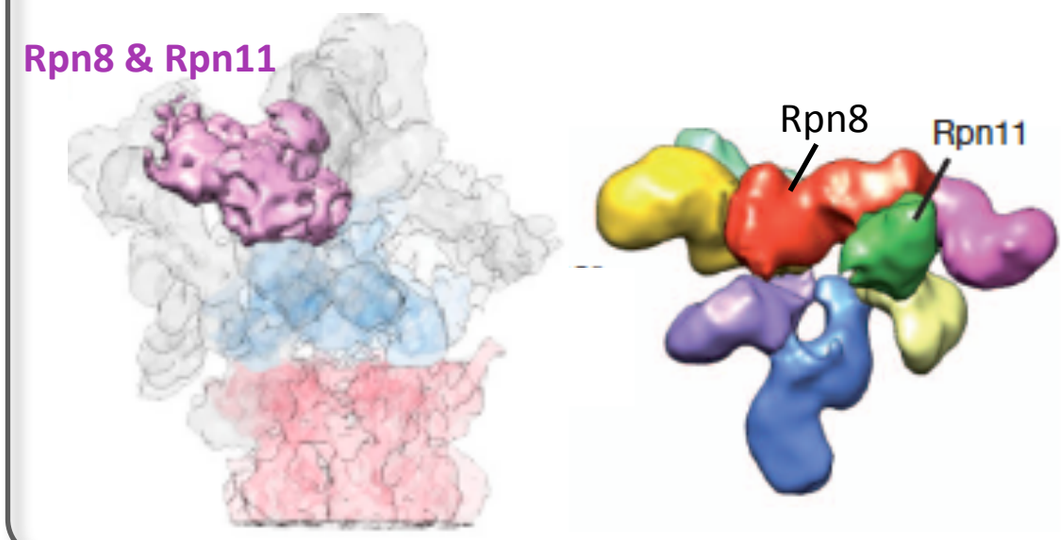
Ubiquitin receptors



PC-repeat containing proteins



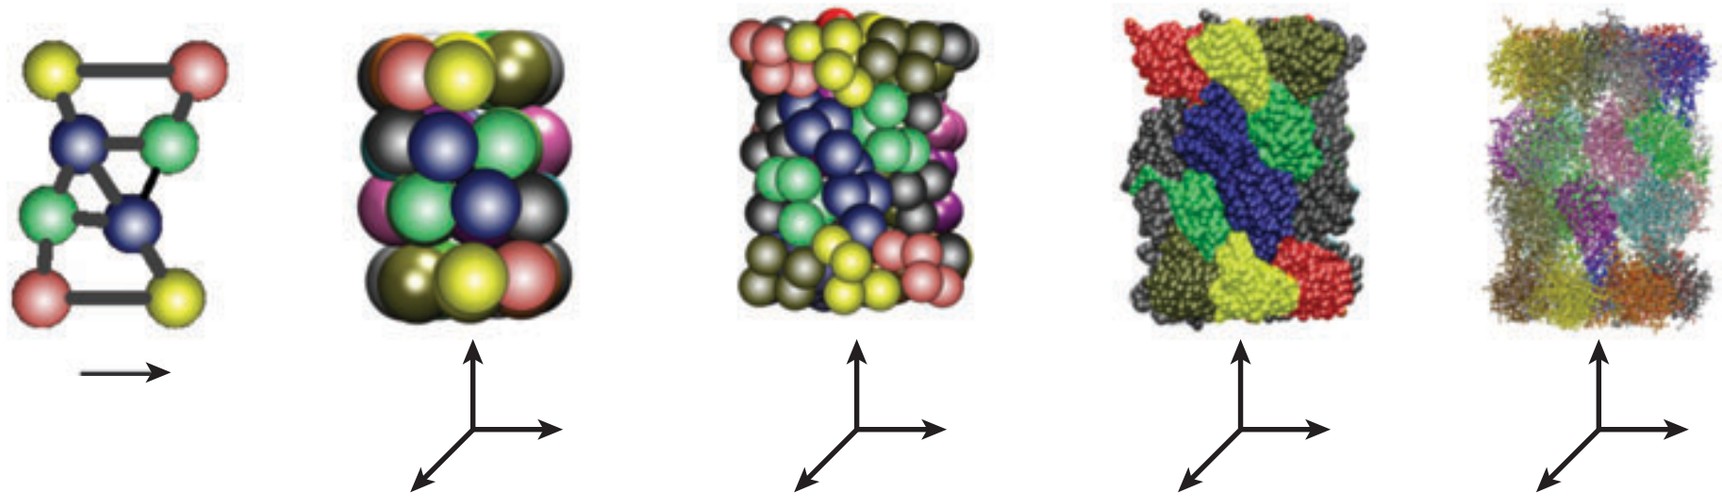
MPN containing proteins



Need for multi-scale (hierarchical) sampling

Component interactions	Component configuration	Molecular architecture	Pseudo-atomic structure	Atomic structure

Component instances



Interaction instances	Component position	Component position and orientation	Residue positions	Atomic positions

Spatial information

Immuno-EM	Comparative modeling	Cryo-EM	X-ray crystallography
